With regard to the influence of harmonics in the rotating field, I will have to differ from the statement which was made that the field would be found to be uniform in its intensity although harmonics were present. Several years ago I was engaged in the testing of some motors, the first motors of the Tesla type, by the way, which were used for commercial work. I had gone over the designs and had tested some preliminary experimental motors and thought I had everything covered with regard to the construction of the motors. A number had been made and in the test of the first one the motor had been carrying its load for an hour or more when I found an unduly high temperature. I found the speed had fallen from synchronism fully fifty per cent. more than it should have fallen, and the motor instead of coming up to a definite temperature kept going up on what was a rather straight line. I had a second generator started and transferred the motor from the generator that had been running to the new one. The speed immediately came to what it should be and the temperature began to fall, although the load was the same. The heating of the motor with one generator was equivalent to what would have been obtained by carrying half or two-thirds additional load with the second generator. The second generator, the good one, gave a curve which was approximately a sine-curve. The other generator gave a wave form which was measured and found to be very much depressed at the middle, where the sine-curve is maximum, showing that the third harmonic was very strongly present.

An analysis of the effect of the third harmonic in the rotating field shows some rather interesting relations. The third harmonic evidently tends to a synchronous speed which is three times as great as the fundamental, so that if we have present a third harmonic we are tending, of course, to two speeds of rotation, the speed of the fundamental and one three times as fast. This third harmonic, however, is negative in its tendency to rotation. That is, the fundamental produces rotation in one direction and the third harmonic not only tends to produce a different speed, but it is in the opposite direction. This can be very simply shown by drawing a sine-wave and its third harmonic, and also a second wave which is a quarter-phase from the first, together with its harmonic. You will notice that if the first fundamental comes before the second one, that the third harmonic of the first comes after that of the second one. Consequently the fundamentals tend to rotation one way, and the third harmonics in the opposite direction. By different relative values of the two we may get almost anything. We may get normal rotation or no rotation at all, or rotation at normal speed in the opposite direction, or twice normal speed or three times normal speed.

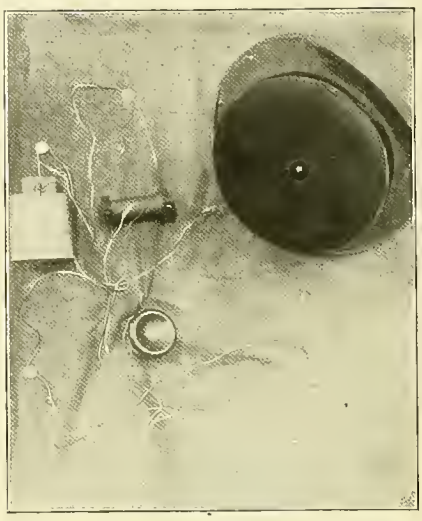

FIG. 3. CLEVER TELEPHONIC DETECTIVE WORK.—EXTERIOR OF THE HAT.

With regard to the higher harmonics in ordinary commercial working, it is to be remembered that those which are produced by iron cores are produced in what may be called the leakage current which flows around these cores, commonly transformer cores, for the purpose of magnetizing that part of the apparatus; and that these higher harmonics will usually be but a small per cent. of the so-called leakage or magnetizing current. Again, magnetizing current in commercial apparatus is in general but a small per cent. of the current at full load, usually only a very few per cent., so that the higher harmonics are only a minor effect in the magnetizing current, and this is to be but a few per cent. of the full load current for which the apparatus is in general designed. Therefore we need not be greatly afraid of the influence of those harmonics in producing trouble in commercial circuits. There are conditions and times when they must be carefully guarded against and profoundly respected.

A beautiful and simple method of showing higher harmonics was called to my attention not long ago by a young man in our laboratory, and is well worth considering. A thin iron plate (one about six inches wide and 18 or 20 inches long gave the best result) is placed in an alternating field set up by current passing through a coil. The familiar tone of the dynamo itself is heard. If the plate be bent slightly, the sound changes. At first it is a sort of a general hum, but by bending the different harmonics are brought out and may predominate. The octave, and the third, and so on, running up the scales, give their different musical tones very clearly and very purely, and by quickly changing the plate you can run through the scale with almost the beauty and clearness of a musical instrument. It might be possible to take all these sounds which are produced by the alternating current, by using some good resonator for giving all the tones together, and then pick them out and thus analyze the different harmonics by means of acoustic apparatus.

Dr. Pupin: In reply to Mr. Scott's remarks I wish to state that in a rotary magnetic field the intensity practically remains constant under conditions specified in my paper. These conditions correspond to practical conditions, when there is no polyphase motor on the circuit. It would never do to exterpolate and guess what would happen under some other conditions. I stated in the conclusion of my paper that rotary magnetic fields produced by reasonably well constructed machines are not accompanied by fluctuations in their intensity. What I mean by a reasonably well constructed machine is simply a machine which produces an electromotive force that may be a complex harmonic; but the upper harmonics are weak in comparison with the fundamental. In the particular machine that my students experimented with, there were upper harmonics, there were the third, the fifth, the seventh and even the ninth, but the rotary magnetic field was nevertheless of constant intensity. As soon as we depart from conditions met with in practice

1. Discussion of paper by Dr. Louis Duncan, I. H. Brown, W. P. Anderson and S. Q. Hayes, before the American Institute of Electrical Engineers, Philadelphia, May 18, 1894, and published in the Western Electrician July 14, 1894.

we can, if we wish, introduce all sorts of complications as in the case described by Mr. Scott, where the generator had a very strong third harmonic.

## Clever Telephonic Detective Work.

Through the co-operation of lawyers, electricians and detectives a clever exposure of an attempt at blackmail was recently made in Chicago by the use of a telephone concealed in a hat. As the result of the ruse a detective in an office building was enabled to listen to the conversation of a rascally lawyer and his intended victim, although the latter two were closeted together in an inner room at a considerable distance from the listening detective. The knowledge, obtained afterward, that his boastful confession had been overheard by a third person induced the culprit to make a full confession.

Briefly stated the facts leading up to this unique use of the telephone are these: Several weeks ago Luther Laflio Mills, the widely known Chicago lawyer, received a business call from Dr. Peter Janss of No. 3411 Cottage Grove avenue, who was in deep trouble, and desired professional assistance. A man had been writing letters to Mrs. Janss. This man, he said, was a lawyer named Charles Ioas, with an office in room 401 Ashland block, with whom Dr. Janss was for some years intimate, but with whom he had a disagreement over a year ago. Soon after the alienation began a clerk in Dr. Janss' office received a typewritten letter signed "Thomas Jefferson," requesting him to hand an inclosed note to Mrs. Janss. The writer said: "Do not let the doctor see it; it's about girls." The clerk, however, handed the letter and the inclosure to Dr. Janss instead of Mrs. Janss. Dr. Janss suspected Ioas at once, and went to him and accused him of it. Ioas boldly admitted it and defied Janss.

Mr. Mills decided at once that additional evidence against Ioas would be necessary before it would be wise to make an arrest. He called in Postoffice Inspector Stuart, and the practicability of proving the crime by comparing the letter with other work done on Ioas' typewriter was discussed. This plan was abandoned, and then Mr. Mills suggested the use of a telephone to get additional evidence of Ioas' confession. Subsequently Mr. Mills consulted with his old friend J. P. Ellacott, an electrician, and a line of procedure was soon agreed upon. During this time Dr. Janss was having occasional interviews with Ioas, in which Ioas would confess his authorship of the letter, but he was careful not to do so in the hearing of any third person. It was decided, therefore, to conceal a telephone on Dr. Janss' person, by means of which a third person at a distance could hear Ioas' confessions.

Of course the great difficulty in the way of executing this plan was the seeming impossibility of concealing a telephone and conducting wires about the doctor so effectually that the suspicions of the wary Ioas would not be excited. The task was, however, entrusted to J. J. O'Connell of the Chicago Telephone company, who exhibited much ingenuity in planning the electrical details that made possible the complete success which attended the bold experiment.

It was decided to place the transmitter in the crown of the doctor's high silk hat, as he was accustomed to wear a tall hat and could easily hold the tile almost in Ioas' face without exciting suspicion. This was done, and the apparatus shown in the accompanying illustrations was used. Fig. 1 shows Mr. O'Connell's plan of wiring the doctor—a very literal example of concealed wiring, in fact. A long-distance transmitter was fastened in the crown of the hat by four leather straps and concealed by a false lining. All non-essential parts were removed, and although the diaphragm was directly beneath the ventilator hole of the hat, it was adapted to receive sound vibrations from all directions. The conducting wires—two in one wrapping—were led between the body of the hat and the lining to the doctor's left hand and under his cuff, precaution being taken to grasp the hat in such a manner that the wire could not be seen. The double wire passed up the left coat sleeve to an inner breast pocket in the coat, where the circuit was divided and connected in such a manner that the transmitter was in series with a battery cell and the primary winding of an induction coil. The battery—a double Fuller cell—was in the inner coat pocket and the induction coil was snugly tucked away in the left hip pocket of the trousers. The connection between these pockets was easily managed, and from the secondary winding of the induction coil the dark-covered double wire passed down the inside of the left trousers leg to a screw and washer on the side of the shoe-heel, where it was fastened, so as to trail after the doctor as he walked. Thus equipped Dr. Janss was in position to offer his hat to Mr. Ioas to be talked through.

Fig. 2 is a representation of the interior of the hat used, with the transmitter fastened in the crown, and also showing the circuit, battery, coil and receiver. Fig. 3 shows the exterior of the hat and also the other apparatus. The induction coil was wound especially by Mr. O'Connell and was of unusual strength. The conducting wires were composed of five strands of No. 34 copper wire wound with brown silk. Two wires thus prepared were combined to form a twin-conductor by an outside wrapping of brown silk. About 100 feet of wire was provided, and the doctor was given several loose coils to pay out if the wire caught on an obstruction in entering Ioas' office. The receiver at the listening end was an ordinary head-telephone.

An appointment for an hour about dusk was made by Dr. Janss with Ioas, and when the decisive moment arrived the apparatus, which had, of course, been tested, was found to work without a hitch. Accompanied by Detectives Sandmeyer and Stuart and Electrical Engineer O'Connell, Dr. Janss appeared on the scene of action. The final touches to the doctor's wiring and equipment were made and he boldly made his way into Ioas' presence, hat in hand, and trailing the tiny wire behind him. The detective with the receiver at his ear sat in an adjoining room that had been secured, while the electrician made occasional sallies into the hallway to keep an eye on the circuit. Ioas, naturally suspicious, took every precaution, as he thought, against being overheard. He took the doctor alone into an inner office, closed and secured the door and even sent a confederate out in the hallway to walk up and down to prevent any listener lingering at the outer door. But no one save those in the secret noticed the wire leading under the door and down the hall to the detective's room. Once assured

FIG. 2. CLEVER TELEPHONIC DETECTIVE WORK.—THE HAT THAT WAS TALKED THROUGH, WITH CONNECTIONS.

that no one but Dr. Janss could hear him, the blackmailer talked freely and without reserve into the doctor's hat, which was only a few inches in front of his nose. In response to the doctor's artful questions he repeatedly admitted the authorship of the letter, and even boasted of it—and Detective Stuart, at the other end, heard it all and carefully took notes. In the meantime the watchful electrician was on pins and needles lest the wire should be discovered. When a janitor came along and placed a pail of water directly on the wire, it looked as though discovery were certain. But the man did not see the wire, and presently went to another part of the building. The conversation lasted nearly an hour, and during it Ioas never suspected that he had been trapped. But afterward, when Inspector Stuart confronted him with a written report of his conversation with Dr. Janss, Ioas broke down and confessed everything to the inspector. The result of this was that United States Commissioner Wirt held Ioas to the grand jury in bonds of $1,500.

The result was due to the fright given to Ioas by the knowledge that his own language had been overheard, and it is doubtful if the evidence of a telephonic listener would have been admitted against him in court. But precisely the calculated effect was produced, and the accomplishment will stand as an exceptionally clever bit of electrical detective work.

As the result of Bell opposition at Toledo and other points the Harrison International Telephone company has announced that it will defend any and all suits for infringement at its own expense and pay all judgments secured.

## BLOW AT THE BELL MONOPOLY.

### United States Circuit Court Decides the Berliner Patent to be Void.

On Tuesday, December 18th, the United States Circuit Court at Boston, in the case of the United States against the American Bell Telephone company, handed down a decision declaring the Berliner telephone patent void.

There were two grounds on which the government attacked the Berliner patent, and on both grounds the court decided against the company. The company has the right of appeal to the United States Court of Appeals within thirty days.

Ex-Solicitor-general Aldrich of Chicago considers this decision a great victory for the fair and just administration of the patent laws. The Berliner patent, he thinks, was undoubtedly delayed in the Patent Office for a purpose, and it would be a travesty on justice to extend the term of the telephone monopoly for the period of this purposely delayed patent. As this suit was begun during Mr. Aldrich's term of office in Washington, in the closing days of the Harrison administration, his friends are congratulating him on his professional sagacity in view of the outcome.

Of course the case will be appealed, but, whatever the ultimate result, the present decision stands as the greatest blow ever given to the American Bell Telephone company. The fact that the court decided adversley to the Berliner patent is greatly to the interest of all telephone users.

## Electric Railways in Chicago.

C. T. Yerkes, president of the North and West Chicago Street Railroad companies, is not popular in Chicago, but it appears that his adoption of electric power is making him better liked. The *Chicago Tribune* of December 9th says: The people of Lake View living in and adjacent to Southport avenue celebrated the opening for traffic of the Southport avenue electric street car line. They were given a free ride on a train over the new road. They cheered and yelled and blowed tin horns all along the line, and the feature of the whole thing was that every time the name of Mr. Yerkes was mentioned they all cheered louder. When they got tired riding up and down the new road the train pulled up in front of Alderman Hage's saloon in Northwest Turner Hall. Refreshments were dispensed there to the enthusiastic citizens. Alderman Hage made a speech. Superintendent Sconnell, representing Mr. Yerkes, responded. Then speeches were called for from M. J. Faherty and E. Kopriwa, the two citizens of Lake View who are given all the credit for the acquisition of the new road. The first car was run over the road Friday evening and the first train for business was started yesterday morning. The line runs on Southport avenue, connecting with the Clybourn avenue cable line on the south and the Clark street electric line on the north. The promotion of the enterprise was begun three years ago.

Western Electrician.

EVERY SATURDAY.

PUBLICATION OFFICES:

6 Lakeside Building, - - CHICAGO.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 534 TEMPLE COURT, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

THE organization of a telegraphic historical society has been effected at Washington, as was noted in this journal last week and much interest has since been manifested in the project. The object of the organization is praiseworthy and appeals to all who are interested in electrical progress even though they may never have been engaged in telegraphy. The gentlemen who have brought the society into existence deserve the commendation of the electrical fraternity.

THE utilization of the electric railway service by the government for the improvement of the mail service, especially in the larger cities, is extending, and it is pleasing to note that the arrangement is highly satisfactory to the postoffice department and the people. Cleveland is the last city to which the attention of the postal authorities has been turned. Last week the assistant superintendent of railway mail service visited that city and made arrangements with the Cleveland Electric Street Railway company for the collection and delivery of the mails. Letter boxes will be placed on electric trains on all the lines. The government proposes to pay the street car company the same rate as is paid steam railroads, which is $42.75 for every 200 pounds per mile per annum. It is probable that the service will be started very soon. If the plan works satisfactorily, it is announced, special electric cars will be built and run over all the lines in the city. The present arrangement will in no way interfere with the regular service of the company, and many advantages may be gained from it.

A PALMYRA, N. Y., correspondent of the *Rochester Herald* suggests the substitution of "electroblight" for "electrocute"—a very badly formed word that has gained wide currency in the daily press as a verb meaning to legally execute by electrical energy. Anything would be better than "electrocute," which is a verbal monstrosity, and we are in hearty sympathy with the *Brooklyn Eagle* and other newspapers that are waging war against this uncouth interloper in the English language. But it is hardly probable that the *Herald* correspondent's suggestion will be a serious competitor for favor, as there are objections to the proposed word, considered either etymologically or euphoniously. Who will propose a suitable and correct term?

THE latest advices concerning the Pacific cable project are favorable to the English scheme. Dispatches from Washington indicate that the agents of the enterprise are busy there. Mr. Hastings of the Hawaiian Legation called upon Senator Morgan recently and informed him that the English were making progress with their project of laying a cable from British Columbia to their colonies in New Zealand, and that the cable would doubtless touch the Sandwich Islands. The people there, he said, would greatly prefer that the cable should be connected with the United States, as that is where the greatest interest lies, but there being no evidence of any intention on the part of this country or any of its people to engage in that enterprise, the English line will be used. Of course, no exclusive right to land the cable on Hawaiian soil will be granted.

ACCORDING to reports from St. Louis, the municipal conduit scheme in that city has not received the cordial support that its promoters anticipated, and as a result it is quite likely the several electrical interests will establish independent conduit systems. There will be a good deal of underground work in St. Louis during the next few years, and the electrical companies, as well as the people, will suffer much inconvenience during the progress of the improvement. But there is no doubt that the city will be better for the change and that it will eventually prove an advantage to the companies, though it would certainly have been much better had the several interests been able to agree upon a system of electrical conduits, in which each company would have an interest. Under the present condition of affairs a clash is inevitable, and there is no doubt that the experience of electrical companies in New York, Chicago and other large cities will be repeated in St. Louis.

CONSIDERABLE freedom is shown by an electric company in criticising a decision recently given by a judge of the United States Circuit Court in a patent case in which the company was interested. The decision was adverse to the claims of the company in question and this seems to have aroused the ire of the "board of directors," for that body has issued a pamphlet addressed to the stockholders of the company in which the judge's action is severely scored. It is contended that the decision of the judge was not warranted and it is announced that the counsel for the company have advised an appeal; but the most singular part of the pamphlet is contained in the statement that the "general manager" of the company "while on a recent visit to New York, was informed by one of the defendant's counsel that they had learned from authentic sources" that the judge before whom the case had been tried "was a man who would not read the testimony, no matter how long he kept it." It seems hardly possible that such a man should occupy a seat in the United States Court. The members of that tribunal are able and distinguished jurists who have the respect and confidence of the community, and such language as that already quoted will be generally considered ill-advised and wholly unmerited.

THE influence of electricity on growing plants has been the subject of study and experiment at different times and by widely separated investigators for over one hundred years, yet very little is known of this influence with scientific exactness. Varying and perplexing results have been obtained, due largely, no doubt, to the fact that the character and strength of the current used were not carefully observed and recorded. It is possible that results of practical benefit in agriculture might be achieved if exact information on this subject were available, and it is therefore of much interest to note that Prof. D. T. MacDougal has planned a series of experiments to be carried on in the laboratory for plant physiology in the University of Minnesota. These experiments will ascertain the effect of current passing through the soil in which plants are growing, and various degrees of current will be used, from one barely perceptible by a sensitive galvanometer up to that taken from the city lighting system. In order that exact measurements and most advantageous use of the current be made, the co-operation of Prof. Shepardson has been secured, and he will personally superintend all of the electric appliances used. The results, it is hoped, will be determinative, and while purely scientific in their nature, may furnish the data from which economic experiments may be made.

APPLICATIONS for franchises in Chicago need constant attention when they are for privileges which, if granted, may make their possessors rivals of the present street railway corporations. If they are not carefully watched they are liable to be "misplaced" or they may disappear entirely. A case of this kind was brought to light in the city council at a recent meeting, when an ordinance was presented granting the Chicago General Railway company permission to construct tracks and operate electric cars on several streets on the South and West sides. This ordinance was introduced a week before by Alderman Engel and referred to the committee on streets and alleys west, of which Alderman Keats is chairman. When the committee met just before the regular meeting of the council it was discovered that the ordinance had mysteriously disappeared. No one in the city clerk's office could furnish any information concerning it. Alderman Keats examined the papers in his box carefully, but he could find no trace of the document which the committee had been summoned to consider. "I cannot surmise what became of the ordinance," said Alderman Keats. "It should have been in the box had the clerks attended faithfully to their duties. I called the committee together to consider this ordinance. As I could not find it we had to adjourn without making any report in regard to it. The petition that accompanied it had also disappeared." Applicants for future favors from that body should remember this experience and profit by it

CONNECTICUT has been the scene of many interesting events in the history of the electric railway, but the present indications promise developments in that state that will surpass everything heretofore recorded there in point of importance. The network of electric railways that now covers the state has caused the steam railroad men considerable uneasiness, and the last year has proved pretty conclusively that the trolley car is a powerful competitor in a thickly populated state like Connecticut. The people have shown a preference for the electric cars, and the steam road companies have been obliged to acknowledge their inability to hold their business in an open competition with the trolley. But the steam roads have not placed any such limitations upon their efforts. Through a powerful lobby they have gained concessions from the State Legislature, and at the present time there is under consideration legislation unfavorable to the electric lines, and consequently in the interest of the steam roads. But the trolley companies have come to realize the danger of their position, and they have already taken steps to guard their rights. Last week a meeting of representatives of electric railways throughout the state was held at New Haven. The meeting took place behind closed doors, but it is admitted that the object of the meeting was to discuss the relations of the electric and the steam roads, and to take steps toward meeting amendments passed by the Legislature so as to put the electrics on an equal footing with steam roads.

The electric companies say that they are now able to take care of themselves, and intend to do so. This will mean a fight in the Legislature between the representatives of the great corporations. There is no doubt that the management of the New York, New Haven & Hartford road is thoroughly alarmed over the progress that the trolley lines have made, and the effect upon the steam roads' business is too apparent to be denied. The consolidated lines have controlled all the business of the state until the electric companies began to cut into their territory. At present the electric lines practically parallel the steam companies' lines from Hartford to New York. There are only a few breaks in the chain and these could be easily supplied if a syndicate were to take the matter in hand. It is this contingency that the managers of the steam company fear, for they realize that such a system would prove a powerful competitor.

## Resonance Analysis of Alternating and Polyphase Currents.[1]

PROF. ANTHONY: I never could see any reason why the rotary field should be distorted or irregular. It seems to me that all these statements that there was an irregularity in the rotary field were based upon the idea that the two quarter-phase vibrations were compounded in a straight line, just as though we had a vibration following along there, and another following along in the same way. But here we have two vibrations at right angles to each other. Here is a vibration in the horizontal plane and another in the vertical plane, and exactly as in the two tuning forks we ought to get a perfect circle, not a complicated vibration, but the compound vibration ought to continually change its angle and remain constant.

MR. STEINMETZ: I think the cause of this discrepancy between the different kinds of higher harmonics, those produced by the generator and those produced by the transformer, is the fact that the ones are higher harmonics of the electromotive force, the others higher harmonics of the current. Thus the higher harmonics of the generator wave are higher harmonics of the electromotive force, and follow the laws of electromotive forces, while the others do not follow these laws, not being electromotive forces. This explains quite a number and probably most of the differences between the one and the other.

The wave of the alternating current generator may be nearly a sine-wave, may be distorted from sine shape due to the shape of the magnetic field in the alternator and so on. This distorted wave of electromotive force can be dissolved into a fundamental sine-wave and a number of higher harmonics of frequencies, triple, quintuple, and so on. These different components will follow the same law. We have in the circuit resistance, inductance and capacity, and according to the conditions of the circuit these various harmonics will be affected.

Take a non-inductive circuit; the current will be proportional to the electromotive force, and in the wave of the current all the various harmonics of the electromotive force will show up in the same proportion. The harmonics of the generator are transformed by the transformer, whose magnetism depends upon the impressed electromotive force, and closely follows its variations. Thus these higher harmonics of electromotive force reappear in the secondary.

Take the case of an inductive resistance, that is, of an induction motor or some apparatus like this: In an inductive resistance a current will flow which is less than corresponds to the true ohmic resistance, due to the counter electromotive force of self-induction. The reactance of self-induction, however, is proportional to the frequency, consequently three times as large for the triple, and five times as large for the quintuple harmonic. Thus the wave of current produced by the multiple harmonic of the generator no longer shows these higher harmonics in the same proportion. It shows them in a decreased manner—a decrease due to the effect of self induction. Thus, if you have a motor in the secondary of the transformer, the motor circuit will not show the harmonic any more, or at least not in the same strengths as the generator on a non-inductive resistance.

It is different with a condenser in the circuit. In a condenser the current is proportional to the electromotive force and the frequency; consequently it would be higher for these higher harmonics.

In other words with a condenser in the circuit of a generator, whose electromotive force wave contains higher harmonics, the current wave will show these harmonics accentuated, while in an inductive circuit they will be more or less suppressed in the current wave, and pass unaffected in a non-inductive circuit. You see that you can get all kinds of phenomena, according to the relative proportion of non-inductive resistance, inductance and capacity. But still you always get the same thing; different electromotive force waves acting upon the same circuit, and the current produced by these waves independently superimposed upon each other to the resultant current.

It is quite different with the second class of harmonics, the higher harmonics of current.

If on a transformer a sine-wave of electromotive force is impressed, the magnetism must be a sine-wave also, if the impedance is negligible, because the counter electromotive force being equal to the impressed electromotive force but opposite, and equal to the change of magnetism, requires that the magnetism be a sine-wave. If the electromotive force is a sine-wave, the current can not be a sine-wave, but the current must be distorted due to the effect of hysteresis, that is, due to the lack of proportionality between current and electromotive force, and this distortion of the current wave means the production of higher harmonics, and the amplitude of the higher harmonics with regard to the fundamental depends upon the difference; the lack of proportionality between current or magnetomotive force and magnetism. Thus, in an open circuit transformer, where the reluctance is nearly all air, you find the amplitude of these higher harmonics of current very much less in proportion to the fundamental than in a closed circuit transformer; or rather in a closed circuit transformer the fundamental is less, while the higher harmonic is the same as in the open circuit transformer (other things being equal), and thus the higher harmonics will more and more disappear in their relation to the fundamental by an increase in the fundamental due to open magnetic circuit or due to the increase of load on the secondary. Such cases are shown in my paper on "Hysteresis—Part III.," which I propose to read presently. You will see that this harmonic is merely produced by the necessity of the current to maintain a sine-wave of magnetism; this is a secondary phenomenon and has no "stability;" that is, no existence independent of the conditions producing it.

It is obvious that these latter higher harmonics cannot be brought to resonance like the higher harmonics of the generator electromotive force, since they are no electromotive forces at all, and only electromotive forces can be brought to resonance.

1. Discussion of paper read by M. I. Pupin, Ph. D., before the American Institute of Electrical Engineers, Philadelphia, May 18, 1891, and published in the WESTERN ELECTRICIAN July 21, 1894.

If the generator does not give a sine-wave, but a wave which contains higher harmonics, and if it feeds a transformer, which, due to the discrepancy between magnetizing current and magnetism, gives higher harmonics also, you get a circuit containing higher harmonics of electromotive force and higher harmonics of current, which according to the circumstances may either aid or oppose each other.

The experiment showing that the hysteresis does not cause any distortion in the alternator armature proves nothing, because it is quite possible that there is no hysteresis in the armature of the generator. There is a waste of energy by molecular magnetic friction; but molecular magnetic friction is not identical with hysteresis as I have shown in my second paper on hysteresis.[1] Magnetic hysteresis is the disproportionality between magnetomotive force and magnetism, as the name signifies, and this disproportionality is produced if upon the alternating magnetic circuit no external energy is expended, since energy is consumed in the circuit by the molecular magnetic friction, which energy must be supplied from somewhere, and in the absence of any other source of energy is supplied by the magnetomotive force in the form of magnetic hysteresis. But this energy may be supplied by mechanical energy, and this is the case in the smooth core machine, and thus we may not find any hysteresis, any disproportionality between magnetic field strength and magnetomotive force.

In a transformer the iron core is indeed set in vibration by the alternating magnetism, but this vibration cannot supply the energy consumed by molecular friction, and thus cannot eliminate hysteresis, because this vibration is produced by the alternating magnetomotive force and has the effect of intensifying the loss of energy—increasing the area of the hysteretic loop by the loss of energy in mechanical vibration, thus intensifying the higher harmonics, since now energy is expended not only by molecular magnetic friction, but also by mechanical vibration. Proof of this increase of hysteresis by mechanical vibration due to the alternation of the magnetism I have also shown in my second paper on hysteresis.[2]

With regard to the ratio of the amplitude of the higher harmonics to the fundamental, I have in the paper which I propose to read a number of such higher harmonics construed from theoretical reasons from the cycle of hysteresis, but I do not find a strict proportionality. It is proportional within a very limited range only, and I believe the exact proportionality which Prof. Pupin found is due to this very limited range of magnetization used in his experiments. So far as I understand he used densities up to $B = 4{,}000$ only. But the proportion changes very much when you go higher. I had a chance to go very high—to go to $B > 20{,}000$. But I found that at these densities the higher harmonics are so enormous that occasionally they obscure the fundamental altogether. You get this effect if you take a transformer built for 125 cycles and 50 volts and run this transformer at 25 cycles and 100 volts, whereby the effective magnetization will go up beyond $B = 25{,}000$. Then the exciting current gets enormous and gets utterly distorted and you can just detect that there is a fundamental left, but the most of the current is higher harmonics.

With regard to this much discussed phenomenon of resonance, let us see what it really means, and whether it is a separate phenomenon at all or merely a special case of a well-known phenomenon.

You know that if you insert in an alternating circuit a self-induction, the self-induction will consume an electromotive force lagging behind the impressed electromotive force by 90° or a quarter period. The resistance will consume an electromotive force in opposition to the impressed electromotive force; and a condenser inserted in the circuit will take a current leading 90°.

Now consider what takes place if you have a circuit closed by a condenser, that is, a circuit whose current leads the electromotive force by 90°, or a quarter period, and have in series with that condenser self-induction.

By self-induction a counter electromotive force is induced which lags 90° behind the current. But the current is 90° ahead of the impressed electromotive force. Thus, the counter electromotive force of self-induction is in phase with the impressed electromotive force and adds itself thereto. Hence the effective electromotive force is increased by the self-induction being brought into phase with the impressed electromotive force, and if this increase is excessive we call it "resonance," but it is nothing different from the action of the choking coil which produces a counter electromotive force 90° behind the current and thereby, according to the phase relation between current and impressed electromotive force, either reduces the electromotive force, if the current is lagging, or increases the electromotive force if the current is leading.

Thus, if you take a condenser with an impressed electromotive force of say 100 volts, and suppose the condenser takes 10 amperes. Now insert a self-induction which with 10 amperes current will produce a counter electromotive force of 100 volts; this counter electromotive force of 100 volts is now due to the lead of the current, in phase with the impressed 100 volts, adds itself thereto and thus gives 200 volts at the condenser terminals, with 100 volts impressed at the generator. These 200 volts will double the current and you get 20 amperes through. These 20 amperes will induce a counter electromotive force of self-induction of 200 volts. Then you get 400 volts at the condenser terminals. That means 40 amperes and 400 volts at the self-induction. So you see that the self-induction in series will raise the condenser electromotive force infinitely, that is, until the increase of current causes the resistance to consume the total impressed electromotive force.

You see it is nothing but our well-known old friend self-induction introducing an electromotive force lagging 90° behind the current and thereby affecting the impressed electromotive force according to the phase relation of the current.

MR. KENNELLY: While this paper appears to give us valuable information concerning an important method of analysis of alternating electromotive forces and currents, it also generally attacks Fleming's theory of distortion of the current wave in alternating current circuits, and I beg to submit that in spite of all that has been said in this paper, and without impugning in any way any of the observations recorded there, the evidence is not in any way conclusive that the existing theory is wrong. I do not mean to say that the existing theory is right, because I hope it is not. I hope it is so far incomplete that there is much more to learn. But it is one thing to say a theory is right, and another to say it is wrong, and I do not think that the evidence here is at all conclusive that the theory is wrong, partly for reasons brought up by Mr. Steinmetz, and partly for the reason that the beautiful method employed by Dr. Pupin is necessarily and fundamentally weak in one great important particular, namely, that while it brings out the harmonic in any periodic current of electromotive force, it does not bring out, and cannot bring out, the phase relations of those harmonics, and that consequently you can have a large harmonic in an alternating current electromotive force or current strength, and the shifting of its phase will produce an enormous difference in the shape of the wave, whether it is in step with the fundamental or whether it is not in step, and as you shift it along, the consequences which will be produced on the shape, and on the results of that shape, may be so great as to totally defeat the conclusions that you would base on your observations.

1. *Transactions*, vol ix., pp. 7 12-716.
2. *Transactions*, vol. ix., p. 715.

DR. PUPIN: I think that I have distinctly referred to an experiment which met the objection of Mr. Kennelly, and that is that the phase relations had nothing to do with the amplitude of the harmonics, as determined in my investigations. No more than it makes any difference in the analysis of acoustic vibrations by means of Helmholtz's resonators, whether the phase relations between the various harmonic components of a complex sound he this or that. As mentioned in my paper, we really care very little for the exact shape of the alternating current wave. What we want is the relative value of the amplitude of the harmonics, and we do not even care whether these harmonics be in phase with the fundamental or not, provided that phase directions will not affect our results, and experiment has shown that they do not.

I have not attacked Prof. Fleming's theory of the generation of harmonics by hysteresis. I brought facts which seem to me to be difficult to reconcile with the hysteresis theory of harmonics. In fact, I do not really see on what foundation rests Prof. Fleming's theory of the generation of harmonics by hysteresis. Nor do I see that there is a sufficiently strong foundation for any other theory. Every investigator, of course, has some temporary physical theory of the phenomena which he investigates; but he generally keeps it to himself as a suggestive guide. If he chooses to offer it to others it is always with a view of inducing them to test its validity. Such a theory seems to me to be Prof. Fleming's theory of the hysteretic distortion of alternating currents, and I fail to see any objection to a reasonable criticism of it. Mr. Kennelly's remarks led me to think that in his opinion Prof. Fleming's theory is beyond criticism, or that, at any rate, my criticism of it is not a reasonable one. I do not think that Mr. Kennelly's discussion of my paper can justify either one of these two views on his part.

Mr. Steinmetz states that my experiments with vibrating and otherwise mechanically disturbed cores seem only to throw some doubt on the hysteresis theory, but that in reality they do not affect it in the least. Hysteresis is affected by mechanical vibrations, according to experiments of Prof. Ewing and Prof. Ryan. Hence if hysteretical processes are affected by mechanical vibrations, and harmonics are due to a hysteretic action, then there ought to be some connection between them. That is, the harmonics being generated ought to be diminished or affected in some way by mechanical vibrations; but they are not. To get out of the way of this difficulty, Mr. Steinmetz simply states that it is not that hysteresis which is affected by mechanical vibrations that causes a distortion of an alternating current wave, but an entirely different kind of hysteresis, namely, molecular friction. A very ingenious way of arguing! But making new hypotheses in order to get out of the way of old difficulties seems to me to help matters very little. I prefer to face the difficulties and try to clear them away by experimental evidences rather than by skillful manipulation of neat hypotheses.

I am very sorry that I did not understand the rest of Mr. Steinmetz's discussion. It seemed to me that what he wished to say was to explain things that I thought were perfectly plain to everybody. We all know that self-induction will offer a larger impedance to higher than to lower harmonics. There is nothing new in that. So far as his explanation of electrical resonance is concerned, it may be very good according to his own taste. It certainly does not suit mine. I do not think that anybody has looked upon electrical resonance as something which is outside the well-known laws and well-known phenomena. Electrical resonance is an ordinary every day affair. At any rate I always tried to represent it as such, and I am sorry that Mr. Steinmetz has not succeeded in catching my meaning. I am quite sure that I wrote a very popular paper on the subject over a year ago and am rather surprised to find Mr. Steinmetz so anxious about the possibility of having people look upon electrical resonance as something mysterious.

MR. STEINMETZ: I think Mr. Kennelly is perfectly right, because what interests us is, how high will the electromotive force go, and so it is of importance to know whether the different component waves will reach their maximum at the same time or whether they will overlap each other, so that when one is high the other is low, and that the sum total will not be increased or will even be reduced.

DR. PUPIN: I wish to correct your statement right here. If we have a certain number of frequencies and the line is in resonance with one of them, it cannot at the same time be in resonance with another. It is only in that case that we could have an overlapping of these different amplitudes.

MR. STEINMETZ. I do not think you understood me. If you have a fundamental of say 10,000 volts and superimpose a triple harmonic of 10,000 volts, you will either get 20,000 volts or you may get almost nothing if they go against each other. I mean the overlapping of the one higher harmonic, which is in resonance with the fundamental, which is already quite high.

With regard to the difference between molecular friction

and hysteresis, and the proof that these are entirely different phenomena, which have directly nothing to do with each other, I may refer to my second paper on hysteresis, where I think I brought conclusive proof of my statement and to my present paper, where I fully discuss the matter.

## New 800 Kilowatt Generator.

The General Electric company is now building at Schenectady one of the largest alternating current generators ever constructed. The machine is to be installed at St. Louis, Mo., in the station of the Edison Electric Illuminating company and will supply current for incandescent arc lighting and for motor service.

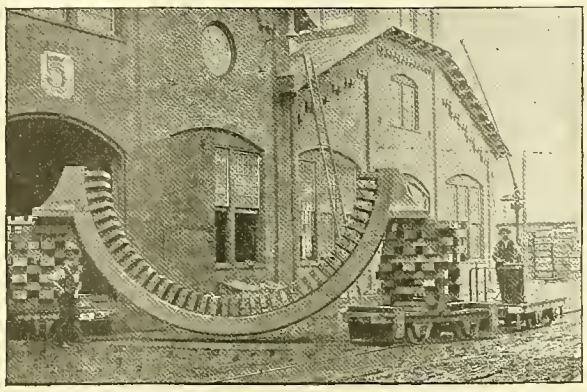

FIG. 1. NEW 800 KILOWATT GENERATOR.

In order to secure efficient results for these various uses, the generator is constructed on the monocyclic system recently adopted by the General Electric company. This system employs a comparatively low frequency of alternations, and the armatures of the generators have special windings adapting them for use on circuits with self-starting current motors.

The generator illustrated is of 800 kilowatt capacity, has 80 poles and is to be driven by a Hamilton-Corliss engine at 90 revolutions per minute.

On account of the great size of the frame, difficulties were to be expected in producing the castings, but thanks to the facilities of the Schenectady works no trouble was experienced in pouring even the large frame casting shown, Fig. 1. This single piece made up in part of wrought iron embedded in the casting weighs 35 tons and measures 24 feet over all. The armature is ironclad and is 16 feet in diameter, weighing nearly 100,000 pounds. The armature will be supported on a 22 inch shaft.

Fig. 2 shows also the armature spider before the laminations were placed upon it. An idea of its size may be had by comparing the spider with the 400 kilowatt rotary converter which stands to the right of it.

The completed generator will supply when at full load 667 amperes at 1,200 volts, equivalent to 16,000 16 candle power lamps.

In this connection it should be stated that the great size of the generator was necessitated by the requirements under which the machine is to be operated, chief of which is the low speed of revolution.

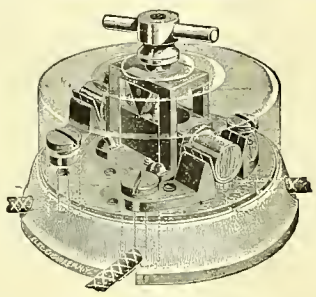
WIRING CALCULATOR.
Copyrighted 1894. BY E. P. Roberts

ROBERTS' SLIDE RULE WIRING CALCULATOR.

## New England Switch.

An excellent idea of the construction and operation of the New England switch can be gained from an inspection of the accompanying cut. It is manufactured by O. S. Platt of Bridgeport, Conn., and is made of the best material throughout. It is strong, neat in appearance, and simple in construction, and is claimed to be the most durable switch on the market.

The contacts consist of copper brushes, for high conductivity, backed up by German silver for spring qualities, and being forced down and held firmly between the contact lugs by the cam, makes the best possible contact—and it is impossible to liberate them without turning the handle.



NEW ENGLAND SWITCH.

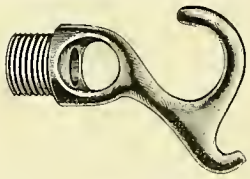
This switch is accepted by electrical engineers throughout the country, and is giving the best of satisfaction wherever it is used. Being on the knife switch principle, it is approved by underwriters.

The stockholders of the Raleigh, N. C., Electric company have decided to authorize an issue of $25,000 of first mortgage bonds for the purchase and installation of their electric light plant and to improve and enlarge the railway equipment.

## Gas Fixture Attachment and Socket Hooks.

The Independent Electric company of Chicago is placing on the market a new lamp fixture attachment, which is illustrated herewith. This article seems to have several specially good points and is known by the name of "Universal." It can be readily and permanently attached to gas fixtures without breaking the gas joint, which is a very desirable feature. It is also very flexible and at the same time strong. Having no soldered joints there is no danger to the lamp even if fitted with a heavy shade. The appearance of this attachment is also in its favor, and there is no doubt that it will meet with good success.

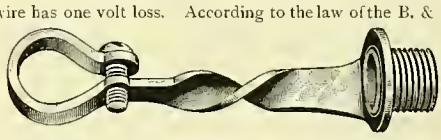
The above company makes a full line of this class of goods, including socket hooks, both single and double, such as illustrated herewith.



GAS FIXTURE ATTACHMENT AND SOCKET HOOKS.

## Roberts' Slide Rule Wiring Calculator.

This slide rule is designed by Prof. E. P. Roberts of the Correspondence School of Technology, Cleveland, O., and its action is readily understood. The scale, as shown in the illustration, consists of a central portion which can be moved relative to the other portion. On the sliding portion is printed the various size wires of the B. & S. gauge, and on the right and left are columns giving ampere feet and volt loss. The starting point in the design of the scale is in the position illustrated. It will be noted that No. 10 wire is in line with 1,000 on the left. As No. 10 wire has one ohm resistance per thousand feet, evidently 1,000 ampere feet of No. 10 wire has one volt loss. According to the law of the B. & S. gange, No. 7 wire is twice the size of No. 10, therefore it will carry 2,000 ampere feet and have one volt loss. No. 4 again doubles, and therefore carries 4,000 ampere feet for one volt loss. Again, if the slide be drawn so that No. 7 is opposite 1,000, then we have twice the size wire we had before for each given number of ampere feet, therefore we should have one-half a volt loss. It will be found that when 7 is opposite 1,000 the arrow is opposite 500; only the portion to the left of the vertical line gives volts, and therefore the 5 is really .5, as the verdical line acts as a decimal point.



GAS FIXTURE ATTACHMENT AND SOCKET HOOKS.

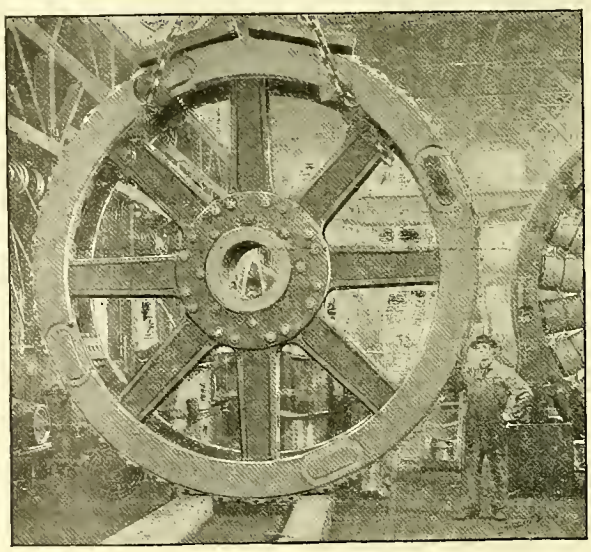


FIG. 2. NEW 800 KILOWATT GENERATOR.

Returning the slide to its original position it will be noted that on the right we have 10,000 in line with No. 10; evidently, if we have one volt loss for 1,000 ampere feet of No. 10, there will 10 volts for 10,000 ampere feet. This gives the starting point for the right-hand column and the other figures are obtained as before.

When the arrow heads are in line the right hand figures represent not only ampere feet but circular mils. This is

because No. 10 wire is 1 inch in diameter and has 1,000 (approximate) circular mils. The approximation is close enough for all practical purposes. Therefore, the area being obtainable, the equivalent of cable, etc., is readily determined.

On the back of the scale is printed carrying capacity and examples of use.

In use, all that is necessary is to place the arrow head opposite the volts loss desired, and the proper size of wire is found in line with the ampere feet. Lamp feet can be used if preferred.

## Degenhardt Memorial Meeting.

On Sunday afternoon, December 16th, a number of friends of the late Fred E. Degenhardt assembled at the Union League Club, Chicago, to pay a tribute to the memory of their departed friend. There was an excellent attendance, although notice of the meeting had been issued only the day before, and those who responded represented every branch of the business. F. S. Terry called the meeting to order and upon his suggestion B. E. Sunny was chosen chairman. Mr. Terry was named as secretary. In opening the exercises Mr. Sunny referred feelingly to the event that had led to the meeting. He spoke of the great loss that had been sustained by the death of Mr. Degenhardt. He said that it had seemed fitting to call the present meeting to take such action as would be deemed appropriate. Mr. Sunny also referred to the active part that Mr. Degenhardt had taken in the development of the different branches of the electrical industry, especially his work in connection with the perfection of underground telephone cables. Mr. Sunny also spoke of Mr. Degenhardt's sterling character and genial disposition. His death was a great and personal loss to all who knew him.

Upon suggestion of F. W. Parker the chairman was authorized to appoint a committee to prepare a suitable memorial, and report to the meeting. The committee, comprising Messrs. Parker, Kreidler and Young, withdrew for consultation, and during their absence addresses were made by several of the gentlemen present. The committee reported the following resolutions, which were unanimously adopted by a rising vote:

WHEREAS, It has pleased an all-wise Providence to remove from among us our cherished friend, Frederick E. Degenhardt, who passed away on the 7th of December, 1894; and,

WHEREAS, We, the friends of Mr. Degenhardt who are engaged in electrical pursuits, desire to voice, as best we may, our deep grief at the demise of our fellow worker, and our sympathy for his family; therefore,

*Resolved*, That we inscribe our names to the following testimonial:

We who met our late friend in the activities of business life had ample opportunity of judging his sterling qualities as a man. We knew him to be keen and diligent in business, an honorable competitor and a model of integrity in all his dealings with his fellow-men. In every sense Mr. Degenhardt was a manly man.

He endeared himself to us all by his ready wit and abundant good spirits. He had a cheery word for his associates at all times, and the electrical fraternity of Chicago numbered no more popular member than he. To meet him was always a pleasure, and we now recall with fond regret the bright incidents of our acquaintanceship with him.

He was singularly happy in his domestic relations, a loving husband, an affectionate father and a devoted son.

Successful and well liked in business, happy in his home and in the prime of a vigorous manhood, the sudden death of Frederick E. Degenhardt comes as a sad mystery and a great calamity to us all.

*Resolved*, That we tender to the surviving members of Mr. Degenhardt's family assurance of our most sincere sympathy. We share their grief and mourn with them.

*Resolved*, That these resolutions be published and that an engrossed copy be given to the family of our friend.

The committee was instructed to have the resolutions engrossed and presented to the family, and upon motion F. S. Terry was added to this committee.

A letter was read from F. G. Beach, regretting his necessary absence and asking that he be allowed to endorse the expressions of regard for the memory of Mr. Degenhardt, and of condolence and heartfelt sympathy for his bereaved family.

During the meeting the following named gentlemen made short speeches, in which they testified their grief at the untimely end of their departed friend and their sympathy for those whom he had left behind:

Charles H. Wilson, F. W. Parker, Chas. E. Gregory, Ben. Williams, E. B. Chandler, J. B. O'Hara, A. S. Terry, W. E. Keily, W. A. Kreidler, J. P. Barrett, F. S. Terry, James W. Johnson, H. P. Lucas, J. C. Kenney, S. F. B. Morse, J. B. Carney, Frank C. Stover, John Young.

Mr. Sunny suggested preparing a memorial, containing a likeness of Mr. Degenhardt, together with the resolutions adopted at the meeting and such other matter as seemed appropriate, and upon motion of Mr. Wilson the committee was instructed to prepare the memorial and have as many copies printed as would be required.

## The Washington Carbon Company to the Front.

A representative of the WESTERN ELECTRICIAN recently visited Pittsburg, and took the opportunity to interview President James S. Humbird of the Washington Carbon company relative to rumors which have been afloat concerning recent improvements in the product of his factory.

As has been well known to newspaper men, the Washington Carbon company for a long time has been working to produce a cored carbon which would compete in quality with those of foreign manufacture. Several times the company's experts were under the impression that they had produced an article which would be up to the standard and compete with the cored carbons from the other side of the water, but more extensive tests showed that the goods were not up to the high standard desired by the Washington company. But after repeated trials, which met with more or less success, they have now ready for the market a cored carbon, which is called "Helios." This carbon, the company claims, is made precisely as abroad, and is conceded, by all who have tried it, to be a remarkably fine carbon.

It might be mentioned here, relative to the name "Helios," that the Washington Carbon company has arranged with the Helios Electric company of Philadelphia to use the trade name "Helios" as applied to carbons; in fact, the Helios company has assigned this right to the Washington Carbon company.

Mr. Humbird further stated that in addition to the works at Washington, Pa., fire-proof buildings have been put up, which will be devoted exclusively to the manufacture of the "Helios" cored carbon for both alternating and direct currents.

In closing the interview, Mr. Humbird, in reply to the question as to whether he could give the WESTERN ELECTRICIAN an exclusive bit of news, said: "The Washington Carbon company has not been working for nothing, and very shortly we will have something entirely new for series arc lighting."

"What's its nature?" was asked.

"Well, never mind that, but I would advise electric lighting companies to go slow in making new contracts."

# CORRESPONDENCE.

## New York Notes.

NEW YORK, December 15.—At this week's meeting of the Rapid Transit Commission President Orr reported for the committee appointed two weeks ago to confer with the officials of the New York and Harlem railroad and its lessees regarding the interferences which would have to be adjusted between that company and the commission, in case the East Side route up Park avenue, suggested by Mr. Parsons, was adopted. The New York Central officials had appointed a committee to meet the committee of the commission. This committee consists of Chauncey M. Depew, Cornelius Vanderbilt and J. Pierpont Morgan. Mr. Orr said that the committee had met Mr. Depew and Mr. Vanderbilt at the office of the commission, and that it had been agreed that Chief Engineer Parsons should confer with Mr. Katte, chief engineer of the Central, and that these engineers should ascertain just how, and to what extent, the proposed East Side rapid transit route would conflict with the structure of the railroad.

The lighting of the city by gas and electricity for the coming year will cost $935,000. The contracts for electric lighting were awarded as follows: The Brush Electric Light company, 295 lamps at 40 cents a night and 92 lamps at 45 cents a night; the United States Illuminating company, 411 lamps at 40 cents a night; the Mount Morris Electric company, 344 lamps at 40 cents a night; the Madison Square Electric company, 299 lamps at 40 cents a night and 10 lamps at 50 cents a night; the Harlem Light company, 210 lamps at 40 cents a night and 19 lamps at 50 cents a night; the Manhattan Electric Light company, 163 lamps at 40 cents a night; the Edison Electric Illuminating company, 107 lamps at 50 cents a night; the North River Electric Light company, 827 lamps at 45 cents a night.

Articles of incorporation of the Staten Island Electric Railroad company have been filed in Albany with the secretary of state. The company proposes to construct an overhead trolley road about twenty-two miles in length between New Brighton and Edgewater and the towns of Northfield and Southfield, Richmond county. The capital is $1,250,000 and the directors are George B. H. Harvey, Milton L. Bonden, John A. Hilton, John J. Walsh, William H. Hurst, John T. Mills, Eugene R. Leland, A. J. Hummell and Henry Haggerty of this city. Nothing has yet been done toward securing franchises from the Staten Island villages, but the plans of the company have been put into such shape that this work will be prosecuted at once after the officers are elected. It is said that the men interested have plenty of capital behind them and if they receive the desired franchises, of which they have no doubt, the work of constructing the roads will go right ahead. They expect, by furnishing good transit facilities and thus opening up a vast amount of territory not now readily accessible, to attract residents to Staten Island and thus soon realize upon their investment.

From Hartford, Conn., come complaints of the obstacles thrown in the way of the improved service of the street car company. On Thursday the company opened the Lafayette street line with trolley cars and ran it for five hours, when it was ordered to stop by the Street Board of the city. The incident has brought out a great many protests on the part of citizens who have been waiting for rapid transit and are anxious that the cars shall begin running as soon as possible. The Street Board passed a resolution at its meeting on Wednesday night forbidding the railway company to start the trolley lines until it had complied with the order compelling fenders and guard wires over the trolley. The fenders have been provided, but the guard wires are not yet in place; the company, however, professes its willingness to put them up immediately. The Street Board has persistently put obstacles in the way of the work of equipment of the electric lines, and the company, having expended half a million of dollars in the equipment, is anxious to start the cars running. The people are none the less anxious, realizing that Hartford is the slowest town in New England in its street car system.

W. F. O.

## Milwaukee, Wis.

MILWAUKEE, December 15.—The Fox River interurban electric railway project is getting out of the muddle in which it has been involved. It is announced that the Wisconsin Interurban Railway company will be incorporated as soon as the necessary franchises are obtained at Neenah, Kaukauna and Menasha. The incorporators, it is announced, will be Charles H. Aldrich, ex-solicitor-general of the United States; Thomas A. Scott, a St. Louis capitalist; Judson T. Sherman of Lake Geneva, and F. C. Ratan and J. M. Thomson of Chicago. It is now the intention of the Interurban company to purchase the street railway plant of the Appleton Edison company, including the track, power house and rolling stock. The company has made arrangements for leasing one thousand additional horse power and plans are being prepared for a power house of greater capacity on the site of the present station at Appleton. It turns out that A. L. Smith, the president of the Appleton Edison company, instead of being behind another enterprise to build an interurban line in the Fox River valley, has been helping the new company to get a franchise. J. K. Tillotson, the chief promoter of the enterprise, says that the new company will have a capital stock of $1,000,000. The company has a franchise to build a road in Oshkosh and will proceed with the work at once without regard to the outcome of the attempts to get franchises in Neenah, Menasha and Kaukauna. C. E. Loss & Co., who would have built the interurban road had franchises been granted in time to allow the work to be done this year, will construct the Oskosh lines. Eight miles of the road in Oshkosh must be completed in four months according to the terms of the franchise. Mr. Thompson, one of the incorporators of the new company, has been spending a great deal of time of late in the cities through which it is proposed to build the interurban line. He got the option on the Appleton line and made a deal for a water power site. From Appleton he went to Menasha. He stated that his company had expected to get the franchises last July and that the amount of $600,000 in capital stock had been awaiting investment in the enterprise for some time. The subscribers, he added, were getting anxious. At the instance of Mr. Thompson an informal meeting of the business men of Menasha was held for the purpose of discussing the situation. Mayor Rosch presided. Thomas Reid, the editor of the leading newspaper at Appleton, appeared in behalf of the company, being actuated, he said, by purely patriotic motives, and urged the granting of the franchise. He had been assured, he said, that the work would be begun just as soon as the franchises were granted. The company's power house would be located at Appleton, where excellent water power had been obtained, and he said that Mr. Thompson has given him authority to say that the company would be prepared to furnish electric light to towns along the route at very low figures. Following Mr. Reid, John Strange and William Gilbert emphasized the desirability of having the road built. All wanted the road if it were properly constructed. The common council, however, should see that the city was protected. Frederick Heineman of Appleton said that he believed that an ordinance which corresponded to that which had been granted by the common council of Appleton would properly protect the city. M. M. Schoetz of Menasha, however, scored Mr. Tillotson, pointed out the mistakes which had been previously made and advised the council to profit by its experience. Mayor Rosch said that the council would not act hurriedly in

granting a franchise, the members preferring to take their own time and make no mistake. It seemed to be the sense of most of the people who attended the meeting that the new company should buy the old street car line, which it is willing to do, but claims that Mr. Schumacher, the owner of the line, wants an exorbitant price for the property. The route from Neenah through Menasha to Appleton was discussed. Should a franchise be granted, a new bridge across the Fox river at the Menasha dam might have to be built, and an estimate of the probable cost of the improvement is being made in order to determine the proportion of the expense that the Interurban company ought to bear. A committee consisting of J. R. Bloom, E. D. Smith, Joseph L. Fieweger, M. M. Shoetz and John Clevis was appointed to investigate Mr. Thompson and his company. Mr. Thompson also visited Neenah and Kaukauna.

The common council of Depere has granted to J. H. Elmore and Frank Van Derzee a franchise for an electric railway to connect that city with Green Bay. The franchise, however, is burdened with the provision that the two projectors of the line shall build a bridge of their own, it being claimed that the two city bridges are both too narrow, as the city will not permit the company to use the roadway. To widen either of the bridges, as has been proposed, would require an outlay of between $15,000 and $20,000. To build a new bridge would of course cost a great deal more. The friends of the project declare that the condition imposed by the common council is simply a clumsy attempt to kill the entire deal without appearing to do so. Mayor Dousman pronounced the ordinance faulty and said that he would veto it. Messrs. Elmore and Van Derzee have got the right of way from Green Bay to the city limits of Depere, and will hold it for two more years. If Depere wants to build the road as an enterprise of her own, as it has been proposed she would be compelled to take the right of way off the hands of the two men to whom she has granted such an illiberal franchise. They stand ready to invest a large sum of money in the enterprise.

The operation of the West Sixth street electric line in Racine has been inaugurated.

Superintendent Schumacher of the Racine street railway has not recovered from a shock caused by the receipt of an offer from a citizen to reimburse the company for damage to one of its cars by reason of the writer's rig colliding with it.

The city of Bayfield now has an electric lighting plant of its own, having purchased the private plant.

Surveyor Powrie of the Waukesha Beach railway denies a report that the Chicago & Northwestern Railway company would operate the line as soon as it is finished. The road, it is asserted, could not be successfully operated by steam, owing to the steep hills. The grading of the road is nearly completed and the work of tracklaying and putting up the poles will soon be commenced. The power plant will be put in under separate bids and will be owned by the company. The road will be operated about May 1st.

The Wisconsin Telephone company has just completed its long-distance circuit between this city and Green Bay. Hitherto Appleton has been the farthest northern point reached. It is expected that the circuit will soon be extended to Marinette.

There is pending in the common council of Oshkosh an ordinance to give F. L. Humes a franchise for the construction and maintenance of a telephone exchange in that city. The ordinance is identical with the one granted to the Wisconsin Automatic Telephone company a year ago. The franchise, it is proposed, shall run for twenty-one years.

The Milwaukee common council has requested City Engineer Benzenberg to prepare detailed plans and specifications for a city electric lighting plant, as well as an estimate of the cost of such a plant. A bill to allow the city to sell electric light will be introduced in the Legislature.

The Milwaukee-Wauwatosa electric cars now make the round trip in eighty minutes. C.

## Northwestern Notations.

MINNEAPOLIS, December 15.—The Winona Electrical company, Winona, Minn., has filed articles of incorporation.

A company has been formed at Dayton, Wash., to construct an electric light system.

The citizens of Rainy Lake City, Minn., the location of the gold discoveries, are agitating for a telephone line to Tower, Minn., 100 miles. The cost is estimated at $2,500, and Fort Francis, Koochiching and the Seine River country are expected to assist in its construction. The Harrison Telephone company is canvassing Davenport, Ia., and Rock Island, Ill., with a view to putting in exchanges.

The city clerk of Missoula, Mont., advertises for bids to furnish from 20 to 25 arc lamps of 1,200 candle power for one, three and five years' contract, the light to burn from dusk till daylight.

Henderson, Minn., will hold another election to settle the electric light question.

It is reported that another company has secured the promise of three-fourths of the present telephone company's subscribers, to take the new service at half the rate now being paid in Minneapolis if the servive is as good. A similar project is being canvassed in St. Paul.

A syndicate has been formed to buy the South Morning Side street car line in Sioux City, Iowa, and turn it into an electric line to be run in connection with the elevated road.

The International Christian Alliance Hospital & Electric Railway company has bought the old Carney house in Emerson, Man., for its first hospital and will use electric lines as feeders to railroads on both sides of the international line.

E. Benedict and F. Potter propose to form a stock company to run a telephone line from Wadena, Minn., to Verndale, and connect with Park Rapids, Hubbard, Menahga and Sebeka.

The New Whatcom, Wash., council has referred to a committee the question of raising funds for building and equipping an electric light plant.

O. N. Bond, W. B. Smith and J. E. Crawford have applied to the Rock Island city council for a telephone exchange franchise. They are also endeavoring to start an exchange in Davenport, and Moline.

Centerville, S. D., will have an electric light system before spring.

The new telephone company which has been canvassing La Crosse, Wis., has secured sufficient subscribers to ensure the exchange being put in.

W. J. Clark, manager of the Broadwater mine, has applied for a franchise for a telephone system in Neihart, Mont.

Waukesha, Wis., business men are seeking to get an electrical appliance concern to locate there. A bonus has been offered which the company thought too low, but the town may increase it.

The $20,000 electric light plant at Oskaloosa, Ia., has burned.

The Neenah and Menasha gas and electric light plant at Menasha, Wis., has been damaged by fire about $200 worth.

A Peru, Ill., syndicate has sent a committee to examine the Rock Rapids, Ia., water works plant, with a view of purchasing it and asking for an electric light franchise.

L. L. Dutton, who fell from a pole of the Winona General Electric company of Winona, Minn., has sued the company for $8,000 damages.

The Twin City Rapid Transit company of Minneapolis and St. Paul is testing a new illuminated street car sign.

J. W. C. Morrison has filed an attachment against the Yankton, S. D., electric light plant to secure a claim of $20,000 against J. T. M. Pierce. M.

## PERSONAL.

J. W. Godfrey and Frank R. Harrington have resigned from the New York Insulated Wire company. These gentlemen are widely known to the electrical fraternity both East and West, and it is announced that Mr. Godfrey will still devote his attention to the wire business.

Martin J. Insull of Chicago was married at East Orange, N. J., on December 13th to Miss Virginia Van Vliet. The ceremony was performed by the Rev. E. W. Babcock of Stonington, Conn. The bridesmaids were Miss Luella Spellmeyer of Newark and Miss Florence Davis of East Orange. Miss Katherine Baker of East Orange was the maid of honor. George de Boketon Greene of New York was the best man, and Waldron Phœnix Belknap of New York and Fred W. Davis of East Orange were the ushers. Mr. and Mrs. Insull will reside in Chicago.

## ELECTRIC LIGHTING.

The new plant of the Osage, Iowa, Electric Light, Heat & Power company, to replace that burned several months ago, is ready for operation. The company has put a new seven-foot dam across the Cedar river two miles west of the city.

The Concord Land & Water Power company at Concord, N. H., has lately contracted for six new arc light dynamos of 75 lamps capacity, Thompson-Houston type, to be added to the plant at Sewalls Falls. It has also just set up the second 250 horse power three-phase generator for lighting, heat and power, and has re-arranged the circuits in the city, making a much more presentable appearance than formerly.

## ELECTRIC RAILWAYS.

Articles of association of a company to construct Michigan's first standard gauge electric railway have been filed. The corporation will be known as the Traverse City, Peninsula & Old Mission Electric Railway company. The capital stock is $160,000. The road will be 20 miles long and will run from Traverse City to Old Mission, via Bower's Harbor, along the east shore of the west arm of Traverse Bay. Both freight and passengers will be transported, and an outlet will be furnished for the entire fruit belt of that region. The incorporators are: J. G. Ramsdell, L. K. Gibbs, J. O. Croster, Ralph Case, J. G. Ramsdell, Anton W. Bartak, W. P. Croster, Charles Wilhelm, W. H. Foster, Elsworth Clark, Frank Votruba and Harry L. Gibbs, all of Grand Traverse county.

It is possible that Detroit may be the pioneer in the movement for lower street car fares. Mayor Pingree is greatly pleased as the result of a five years' fight against the Citizens' Street Railway company is an ordinance granting a franchise to the Detroit Street Railway company to put in a rapid transit system on many of the streets of the city to compete with the Citizens' company in some portions of the town. Vice-President Hutchins of the Citizens' company has given formal notice to the Packs and H. A. Everett that his company claimed the right to build on all the streets offered the syndicate. The thirty-year ordiance provides that all lines must be running by January 1, 1896; that seven tickets be sold for a quarter, except that from 10 P. M. until 5 A. M. six tickets shall be sold for a quarter; general transfers over the company's lines; the city to do the paving between the tracks and keep it clean; the company to pay regular tax on property.

A press dispatch from Pittsburg, December 14th, says that an all-night electric car on the Duquesne line of the Pittsburg Traction company was held up at Oakland early in the morning, and the passengers were robbed. The car left Wood street in the down-town portion of the city at one o'clock. It was crowded, and made a fast run to Oakland. Here there remained in the car a man and three women accompanied by another man. Near the entrance to Schenley Park three masked men jumped on the rear platform. The conductor was thrown down and his pockets rifled while the car went at full speed. One man guarded the conductor and the others went through the car with drawn revolvers. Two of the women fainted. The passengers were robbed of their money and jewelry. At Craig street the three men left the car and the conductor notified the corner policeman. The street car company officials deny the story, and claim it is founded upon the picking of a conductor's pocket The police also pooh-pooh the story, but are understood to be working on the case, as the Duquesne company may be the defendant in heavy damage suits, instituted by the robbed passengers.

## ELECTRIC MINING.

A new colliery which is just being opened under American proprietary anspices near Eckington, Derbyshire, will serve as practical example of the utilization of electric energy. Chandos Pole is the owner of the colliery, which is to be lighted and worked entirely by electricity. High pressure boilers with high speed steam engines will be put down with suitable dynamo and motor plant. The under cutting of coal will be done entirely by electric coal-cutting machines of the latest design, and the ventilating fans will be driven by separate motors of their own.

## TELEPHONE.

Suit has been begun in the United States Circuit Court at Chicago involving the right to the use of recent telephone improvements. The complainant is the Western Telephone Construction company and the defendants Andrew Carlson and Alfred Stromberg of the Stromberg & Carlson Telephone company, Chicago. The defendants are the patentees of two telephone devices, one increasing the power of the receiver and simplifying the signal bell and the other a switch on the receiver, both of which are used conjointly. On October 21st Stromberg and Carlson sold the right to the patents to the Western Telephone Construction company, which alleges that the defendants are manufacturing and selling telephones equipped with the new devices.

Druggists and doctors of Englewood, Chicago, have been victims recently of a gang of thieves and robbers. This was the scheme: A druggist was notified late at night by telephone that a fire was raging somewhere in the down-town district and asking him to inform a neighbor said to be interested. When the druggist ran out on his supposed errand of mercy he was either held up or his store entered and looted in his absence. In the case of the doctors a notification was sent in that some one was dying not far away, and when the doctor hurried out he was promptly sandbagged. When this had happened several times word was passed around and the practice was partly broken off. The police are also watching the matter closely.

The Birmingham, Ala., *News* says: Conversation is now going on between this city and Memphis, Tenn. The medium is the long-distance telephone of L. M. Ericsson & Co. of Stockholm, Sweden. The patents are owned in Sweden by the inventors, who are connected with the firm named. The owners have resolved to introduce the telephone into this country, and it was in accordance with this intention that the experiment between Memphis and Birmingham was introduced. It is the first trial of the telephone on this side of the Atlantic. The connection at this end was made in the office of the Postal Telegraph company. Conversation was had with Memphis with some ease, although the distance is 380 miles. A *News* reporter and others talked through the instrument with satisfaction.

## TELEGRAPH.

A dispatch from San Francisco, dated December 7th, says: The Western Union Telegraph company has appealed from the decision of the United States Circuit Court for the Southern District of California in the case of the Western Union Telegraph company against the Postal Telegraph company. The suit was decided in favor of the Postal in the lower court. It involves the construction act of congress by which the Atlantic & Pacific railway received its franchises. The railway company tried to grant exclusive rights to the Western Union, but the court held that the Postal had equal rights.

## MISCELLANEOUS.

The horse is easily killed by electricity. It is popularly supposed that the current, on entering the body, meets with some physiological susceptibility that makes this animal more vulnerable than others to the action of such a current. The London *Lancet* holds that there is no good ground

for this assumptioo. The explanation lies elsewhere. The hoof, and more particularly its crust and sole, is a good insulator, but the shoe presents to the ground a large metallic contact, and this contact is in connection with metallic conductors in the shape of nails, which pierce the strongest part of the insulatioo and afford an easy electrical path into the body. The contact with earth is further improved by the great superincumbent weight of the animal, and it may often happen that in passing over wet ground the external surface of the hoof and the wet fetlock, especially in the case of untrimmed horses, may become sufficiently wet to form a good surface conductor, and so carry a current directly from the earth to the upper part of the body. In this way the safety of the natural "resistance" of the hoofs is neutralized. A horse, too, covers more ground than a man and runs greater risk from being in contact with points of ground farther apart. Horseshoers ought to bestow extra care upon the driving of the nail, to see that it does not penetrate to the "quick."

## TRADE NEWS.

The Standard Underground Cable company of Pittsburg has been deprived of its western manager by the lamentable death of Fred E. Degenhardt, but the Chicago office will still remain at 542 Rookery. F. S. Viele, superintendent of construction for the western department, will be in charge for the present.

The latest catalogue issued by the Electric Engineering & Supply company of Syracuse, N. Y., is complete and comprehensive. Railway, lighting and all other kinds of supplies are discribed in this work. The company has an excellent reputation for workmanship and first-class material in all its products, and to judge from the appearance of the last catalogue it is the intention of the managment to keep up to the standard already established.

The clothing factory of the Charles R. Lewis Clothing company, Belleville, Ill., has been equipped with a 30 kilowatt Mather generator for supplying light and power throughout the building. Electric heating irons are also used. One engine drives the generator and also the elevator. Exhaust steam is used for heating purposes. The building is a four-story brick factory building formerly used for other purposes. The factory occupies the fourth floor, while the other floors are used for store rooms, offices and power plant.

The Clonbrock Steam Boiler company of Brooklyn, N. Y., reports that the last year has been the largest in its business, its factories having been kept working over time all the while to keep pace with the orders. The company is now building an addition to its already large works to meet the rapid growth of the business. A recent order that will reach 4,000 horse power was sold to the Cleveland Electric Illuminating company of Cleveland, O. The total shipment will be thirty cars and the weight 500 tons. The first installment of this order, twelve cars, was sent last week. The Terre Haute Electric Railway company of Terre Haute, Ind., has purchased two 500 horse power boilers recently, and the Merrimac Manufacturing company of Lowell, Mass., has placed an order for four 1,000 horse power generators. The business will continue in the charge of Thomas J. Lawler, who is known far and wide to the manufacturing interests, while the office and financial management will be in the hands of S. V. Morrin, who, although a young man, has demonstrated his ability, and the practical knowledge gained by him in working up from the bottom to his present responsible position will prove of service to the company.

## BUSINESS.

The Washington Electric company's annunciators continue to be in great demand. The shops at 201–207 South Canal street, Chicago, present a scene of activity that demonstrates that this company is achieving a gratifying degree of success in its bid for business.

Linton & Southwick of Worcester, Mass., have issued a complete catalogue and price-list of their station switches and apparatus. This firm makes a specialty of this class of work, employs skilled labor, and manufactures in large quantities, and is therefore able to assure its customers that they will obtain thoroughly good and reliable work and materials at a reasonable price. No switch is allowed to leave the factory as to which there is any question.

The Naugatuck Malleable Iron company at Naugatuck, Conn., has placed the contract for its new annealing room with the Berlin Iron Bridge company of East Berlin, Conn. The building will be 94 feet wide and 175 feet long, constructed entirely of fire-proof construction The Berlin company is building a new gas house roof for the Massachusetts reformatory at Concord, Mass.; and the same company is furnishing the iron work for the new office building of the Pope Manufacturing company of Hartford, Conn.

The Mather Electric company of Manchester, Conn., has just been awarded, through its New York contractors, H. B. Coho & Co., the contract for three 100 kilowatt direct-connected generators of the new type, for the lighting plant of the new Congressional Library building at Washington, D. C. Very extensive tests of this new apparatus were made by government experts at the Manchester factory, and the adoption of this apparatus by the United States government reflects great credit on the Mather Electric company.

The Elwell-Parker Electric company of America has issued a very handsome catalogue, showing several machines manufactured by this company. The Elwell-Parker dynamos, motors and electrical apparatus have a high reputation in Great Britain and all parts of the world, and the Elwell-Parker Electric company of America, in placing these machines on the American market, is sure that they will at once take the same high position in this country. This company announces that it will be glad to furnish further particulars and detailed estimates on application.

E. S. Ford and S. J. Smith, under the firm name of Ford & Smith, have opened an office at 48 Wade building, Cleveland, O., as contracting engineers for electrical plants. They are prepared to install lighting and power plants of any size, and will undertake any kind of electrical construction or repair work. Mr. Ford was secretary of the Ford-Washburn Storelecto company for three years, and Mr. Smith, who is a practical engineer, was for two years secretary of the Brightman Stoker company. Both are well acquainted in electrical and mechanical circles.

The American Electric Supply company of Buffalo, N. Y., has severed its agency relations with the Interior Conduit & Insulation company of New York. The American Electric Supply company is one of the oldest agents of the Conduit company and the relations between the two companies have always been of the pleasantest character. The Conduit company, however, announces that it has found that its interests are antagonized when represented by a construction house and has consequently changed its policy and in the future will be represented by supply houses not engaged or financially interested in the construction business. The American Electric Supply company could not afford to give up the large construction business it enjoys, and hence followed a friendly termination of its agency relations with the Interior Conduit & Insulation company.

The increase in electrical business now being done by the General Electric company has necessitated an extension of the already extensive facilities at Schenectady, and two large buildings are now being constructed by Grattan & Jennings. One of these is a storehouse, 353 feet long and 52 feet wide. The foundations are already laid and the superstructure is rising rapidly. This will relieve the smaller storehouses, now found entirely inadequate. The other building will be used as a laboratory for standardizing. It will be erected on the very outskirts of the tract of land owned by the company at Schenectady, in order that it may be as far away as possible from the disturbing influences of moving iron and heavy electric currents in and around the many buildings of the plant proper. This laboratory will contain all the standard instruments of the company, and with these the working instruments, which are in use throughout the factories for testing purposes, will be compared each day.

The announcement is made officially that the Electric Storage Battery company, Philadelphia, has acquired all the patents and patent rights for the manufacture of electric storage batteries of the General Electric company, the Edison Electric Light company, the Thomson-Houston Electric company, the Brush Electric company, the Accumulator company, the Consolidated Electric Storage company and the General Electric Launch company. This arrangement, it is claimed, will give the Electric Storage Battery company exclusive control of the business in this country. The acquisition of these patents not only terminates all litigation heretofore existing, but insures the company against future attacks, as the patents acquired, together with those originally owned by the Electric Storage Battery company, cover all the known principles involved in storage batteries. The company announces that it has increased largely its cash working capital, and is fully prepared to fill all orders for storage batteries promptly. Catalogues containing full description of the several types of elements, weights, capacities, dimensions, etc., and instructions for installing and caring for batteries have been issued by the company. The headquarters will continue at 838 Drexel building, Philadelphia.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued December 11, 1894.*

530,497. Street Sign. Halsey H. Baker, Plainfield, N. J. Application filed January 22, 1894.

The third claim is for the combination with an electric lamp and its reflector of arms passing around the outer edges of the reflector, signs connected with the lower ends of such arms, a clamping ring with which the upper ends of the arms are connected, and a bracket receiving and supporting the clamping ring.

530,498. Insulator for Electric Overhead Construction. Henry P. Ball, Bridgeport, Conn. Application filed June 28, 1894.

A strain insulator is provided with a flange having one diameter of its opening greater than the other, an eye-bolt having an engaging part formed with one diameter smaller than the other, the two parts being arranged and adapted to engage when the longer diameter of the eye-bolt is transverse to the short diameter of the flange, and insulating material securing the parts together and insulating them from each other.

530,507. Controller for Electric Locomotive. John W. Darley, Jr., Baltimore, Md. Application filed November 16, 1893.

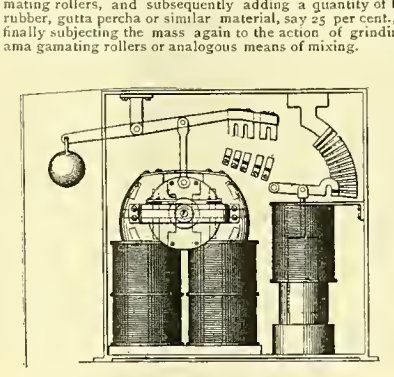
A plurality of electric motors is arranged in groups, a commutating cylinder is adapted to connect them in series or multiple, and a cut-out cylinder is arranged to cut out any disabled motor from a group in all positions of the commutating cylinder and to cut out its mate only in multiple positions, whereby the power of the mate may be employed in the series positions, while the balance of the circuit is preserved in the multiple positions.

530,516. Suppression of Self-inductive Obstruction in Electro-magnetic Apparatus. Stephen D. Field, Stockbridge, Mass. Application filed July 24, 1894.

The last claim is for an electro-magnet comprising the following elements in combination: a core capable of being magnetized, a winding or helix of two or more layers surrounding the same, and one or more incomplete inductive circuits placed in inductive relation to the said helices.

530,517. Process of Manufacturing Insulating Compositions for Electrical Purposes. Alfred N. Ford, London, Eng. Application filed June 11, 1894. Patented in England July 17, 1890.

The process described for the manufacture of insulating compositions consists first in coating or saturating certain fibrous and other substances with a drying oil which has been previously partially oxidized, and then drying these fibrous substances so treated, and, when dry, re-coating them again and again, each time drying the previous coat sufficiently to take another coat until the mass has increased in weight by such coating or saturation rom 50 to 200 per cent. approximately, and subjecting the material so treated to the action of grinding or amalgamating rollers, and subsequently adding a quantity of India rubber, gutta percha or similar material, say 25 per cent., and finally subjecting the mass again to the action of grinding or ama gamating rollers or analogous means of mixing.



NO. 530,541.

530,522. Galvanic Ring. David Hattenback, Sioux City, Ia. Application filed September 4, 1894.

A metallic ring in two parts soldered together, the metal in each part differing from that in the other part, forming in the completed ring positive and negative electrodes, is described.

530,541. Apparatus for Controlling Electric Elevators. Nils O. Lindstrom, Union Course, and Orrie P. Cummings, Brooklyn, N. Y. Application filed September 10, 1894.

The controller illustrated comprises an auxiliary electric motor having a non-commutated armature circuit, the polar axis of the armature normally lying transverse to the field of force, a controlling switch on the elevator car for reversing the direction of the armature torque, and reversing switches in the main motor circuit attached by the auxiliary motor.

530,543. Condnit Electric Railway. David Mason, Schenectady, N. Y. Application filed June 8, 1893.

The cut shows an electric railway system having one or more hollow or tubular trolley conductors held in a slitted conduit in close proximity to the surface of the road-bed, in combination with an electrical generator connected thereto, and an apparatus for forcing heated liquids, vapors or gases through the hollow or tubular conductors.

530,569. Trolley Wire Clamp. Montraville M. Wood, Chicago, Ill. Application filed July 2, 1894.

A trolley wire clamp having two jaws, each provided with projecting lugs, an interlocking pin passing through holes in the lugs, a stud bolt by which the clamp is supported, a cone shaped wedge encircling the stud bolt, a groove in each jaw for the reception of the wedge, and means for forcing the wedge into the grooves, so as to spread the jaws apart at the top and cause their clamping edges to firmly grip the t olley wire, is described.

530,575. Telephone Transmitter. Arthur F. Boardman, Somerville, Mass. Application filed August 6, 1894.

In a telephone there is an offset, an electrode, a support mounted on the offset, an adjusting screw mounted on the offset for adjusting the pressure of the electrode, consisting of a threaded shell containing a cork stopper for bearing against the electrode, and a device for locking the adjusting screw.

530,578. Electric Elevator Controller. Leroy S. Buffington, Minneapolis, Minn., and Walter C. Jones, Chicago, Ill. Application filed February 23, 1894.

An electro-magnetic device adapted to control the motive power, a switch adapted to control the operation of the electro-magnetic device, a pivoted bar, an elevator door suspended therefrom, an electro-magnetic device, an element adapted to be placed thereby in position to be engaged by the moving elevator car, and thereby to raise the end of the pivoted bar to cause the door to open, the door being adapted in its movement to actuate the switch, and switching apparatus upon the elevator car and adapted to control the second mentioned electro-magnetic device, whereby the door is automatically opened and closed, and the car is automatically brought to rest opposite a predetermined floor.

530,597. Alternating Current Transformer. Alexander W. Meston, St. Louis, Mo. Application filed January 23, 1893.

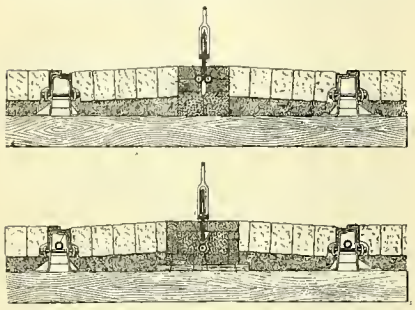
In this transformer, as sbown, the features consist of the primary coil, two segmental strips, insulated from each other, in the circuit thereof, a secondary coil provided with branch terminals, contact buttons arranged in an arc of a circle to which the terminals lead, a centrally pivoted switch for adjustably cutting in the secondary coil by its contact with the buttons, and a spring contact on the switch for maintaining electrical connection between the strips.

530,598. Telephone System. Wilhelm Oesterreich, Berlin, Germany. Application filed October 12, 1893.

The telephone system illustrated is provided with a multiple switchboard, a testing wire connected with the earth, and provided with a weak battery, a galvanometer in a branch wire, and a contact for connecting it with the circuit to be tested, and a switch provided with a depressible and oscillatory lever, operating when depressed to leave the contact and touch the contact, and operating when moved to one side to move the springs clear of the contacts and place them in contact with other conta ts.

530,619. Electtic Motor Propelled Elevator. Frank E. Herdman, Indianapolis, Ind. Application filed January 31, 1893.

Claim 1 reads: In an elevating apparatus, the combination with an electric motor provided with extra coils upon the field contacts, each contact in electrical connection with one coil, and a return wire to one of said contacts, electric connection between said contact and source of current supply, an arm adapted to pass over said contacts, electrical connection between said arm and the source of current supply, traveling sheaves lifting table wound around said sheaves and connection between said lifting cable and said arm, adapted when the strain on said lifting cable is increased beyond normal to draw said arm over said contacts.



NO. 530,543

530,637. Electric Cigar Lighter. Clyde J. Coleman, Chicago, Ill. Application filed March 24, 1894.

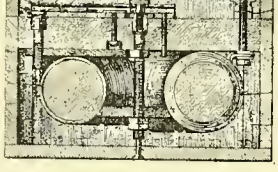
In an electric cigar lighter there is a pendent lighter casing carrying an incandescent conductor and having a weighted handle, a suspending cord attached laterally to the casing and inclosing the electric conductors, a circuit-closer consisting of closed casing arranged in a removable manner in the interior of the lighter casing, and containing a body of mercury, and contact points passing into the interior of such circuit-closer casing, so as to contact with the body of mercury when the same flows downward in such casing, in the operation of raising the lighter for use.

530,648. Fire Alarm and Annunciator System. Frederick S. Palmer, Boston, Mass. Application filed March 24, 1894.

A fire alarm system, a call system, and independent batteries for each system, two thermostats electrically united with the fire system, one thermostat being arranged to short-circuit the battery in the fire system through said system, the other thermostat to short-circuit the battery in the call system through the annunciator apparatus of the system, and through the fire system in part.

530,661. Switch for Overhead Trolley Tracks. Charles G. Schmidt, Cincinnati, O. Application filed August 13, 1894.

In a switch for overhead trolley tracks, the combination consists of the switch hinged to the main track, the branch tracks, the hangers supporting them, each provided with a support for the free swinging end of the switch to rest on when in alignment with either track, a guide bar supported by and on these hangers, which support the switch and track ends, guards carried by the guide bar and an operative connection between this latter and the switch.



NO. 530,597.

530,674. Trolley Wire and Support Therefor. Herbert H. Ashley, Springfield, Mass. Application filed August 25, 1894.

The support consists of the two parallel opposing longitudinally ranging cheek plates suitably united at and between their upper portions, whereby there is left clear between their opposite portions, at each end of the support, downwardly and endwise opening spaces, and having near such ends the slots which incline in directions downwardly and toward the middle of, and which open to the lower edges of the cheek plates, and said cheek plates having their lower edge portions continuous and unobstructed between the said slots, in combination with the trolley wires, having provided at their end portions and above the longitudinal line thereof the lateral oppositely extending projections, which are adapted to have engagements in said inclined slots, all whereby the trolley wires will be detachably supported to lie along the level of the lower edges of the said cheek plates.

530,688. Conduit Railway Trolley. Joseph C. Hawley and William J. Black, Duncannon, Pa. Application filed March 22, 1894.

The invention consists of a depending standard of the guide frame, the hand lever, the link attached thereto and the cam-shaped lever pivotally connected at its end with the link, and pivoted intermediate its ends to the standard, the cam face of the lever being adapted to bear upon the guide frame, whereby the standard is raised.

530,706. Insulator. Louis McCarthy, Boston, Mass. Application filed September 18, 1894.

An insulator comprising a metallic case has a downwardly projecting skirt with perforations therein, and a mass of insulating material applied to both the interior and exterior, as well as the edge of the skirt, and passing through the perforations, the edge portion of the skirt being embedded in the insulating material.

530,717. Brush for Dynamo-electric Machines. Edward T. Platt, Chicago, Ill. Application filed June 11, 1894.

A dynamo or other electric machine, a commutator brush provided with a flexible body portion, a contacting portion formed of a series of copper rolls having hardened steel pivots and brass-bearing portions for such roll pivots se ured to the body portion of the brush.

530,727. Rheostat. Thomas W. Shelton, St. Louis, Mo. Application filed August 20, 1894.

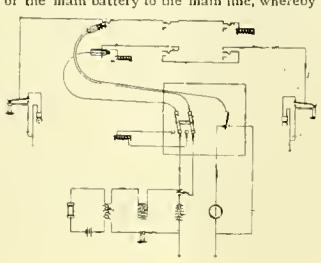
A rheostat is described, comprising a cylindrical casing provided with a vertical slot in its face, a vertical rib on the interior of its wall, a suitable cover for the casing, a series of fire-clay disks located within the casing, the disk being provided with convolute grooves in their faces and semi-circular depressions in their edges, suitable conductors embedded in convolute grooves or depressions, bolts securing the disks together in pairs, and conductors leading from the bolts to the outside of the casing.

530,748. System of Transmitting and Distributing Electrical Energy. Cummings C. Chesney, Pittsfield, Mass. Application filed April 19, 1894.

The method of transmitting and distributing electric energy, which is illustrated in the cut, consists in generating three-phase currents of low frequency and high tension; by these operating a motor, which, in turn, drives a two-phase generator adapted to yield currents of high frequency and distributing these currents to translating devices.

530,762. Electrical Block Signal Apparatus. Urias J. Fry, Milwaukee, Wis., and George M. Basford, Oak Park, Ill. Application filed July 5, 1893.

The invention consists of a system comprising a main line or circuit connecting distant stations, each of which is provided with a battery and a suitable signal, of a locking device for each signal, comprising an unlocking magnet in a local circuit with the main line battery, a polarized relay controlling the local circuit, and arranged to positively shift its armature in opposite directions when energized by currents of opposite polarity, and to automatically return the armature to its normal position when the main circuit is broken, signal transmitting and receiving instruments at each station, a switch arranged to connect either the transmitting and receiving instruments and the battery or the polarized relay of each station with the main line, and a pole-changing switch at each station arranged to reverse the poles of the main battery to the main line, whereby the entire



NO. 530,598.

energy of a single battery at each station is utilized for transmitting signals, operating the polarized relay of the distant station and unlocking the signal of the local station.

530,763. Block Signal Apparatus. Urias J. Fry, Milwaukee, Wis., and George M. Basford, Oak Park, Ill. Application filed September 17, 1894.

The first claim is for a main line or electric circuit connecting stations, each of which is provided with a signal, an electromagnetic signal-locking device and means of releasing the locking device of the distant station, of a circuit-breaker adapted to render the signal releasing means inoperative after it has been operated, a magnet controlling the circuit-breaker in a local circuit provided with two circuit-breakers, which are controlled by separate train circuits or track instruments.

530,764. Primary Battery. George H. Gardner, Boston, Mass. Application filed March 2, 1894.

In a primary battery an annular metallic contact plate is molded into the material of which the cell is composed, and having its edges overlaid by the cell material and adapted to form a metallic lining for that part of the bottom of the cell that lies between the porous cup and the walls.

530,773. Electric Motor. Frank E. Herdman, Winnetka, Ill. Application filed July 25, 1894.

An electric motor, a switch, electric connection from the switch to the armature of the motor, resistances in the circuit, an arm adapted to travel over the resistances and increase the amount or strength of current in the circuit to the armature of the motor, actuating mechanism for operating the arm, a device adapted to retard the movement of the arm over the resistances, mechanism for varying the retarding strength of the device, a solenoid in circuit with the circuit to the armature of said motor, and connection between the solenoid and regulating mechanism of retarding device, the connection being such that when the solenoid is excited the mechanism is thrown into action to increase the retarding strength of the device

530,798. Railway Signal. James V. Richardson, Farmville, Va. Application filed March 30, 1894.

Parallel line conductors are arranged in blocks, as specified; contact devices are carried by a locomotive to engage the conductors and a signal in circuit with the conductors; a circuit-breaker connects the blocks of line conductors, the circuit-breaker having cross-connections to connect the positive conductor of one block to the negative conductor of the next, and connections to connect the positive and negative conductors of one block to the similar conductors of the next.

530,804. Battery Switch. Heinrich K. Spangenberg, Leipsic, Germany. Application filed July 24, 1893.

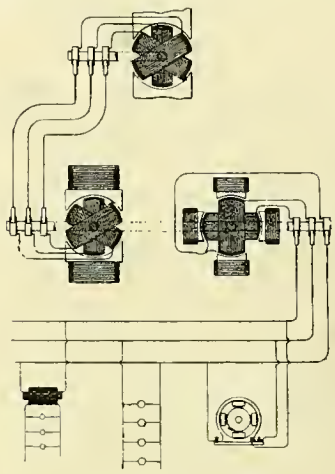
Two sets of cells are employed, and the switchboard regulates the number of cells in use. It is provided with terminals independently connected with the positive and negative poles of each set of cells, the distributing board is provided with two plates adapted to be connected with the line wires and a connecting plate or plates insulated from the first named plates, and pins connected with the terminals for engaging the plates for cutting out one set of cells or for connecting the sets of cells in series or multiple arc.

530,828. Conduit Railway Trolley. Walter E. Delabarre, Francis M. Frazer and Robert A. Carrick, New York, N. Y. Application filed January 26, 1894.

The conduit has a slot and a guard plate on one side, and the conductor is held in the conduit laterally of the guard plate, a transmitting arm is adapted to project through the slot, a trolley connected to the arm and adapted for contact w th the conductor, and an insulating covering connected to the arm and arranged essentially beneath the guard plate, the covering being provided, intermediate of the trolley and the vertical line of the guard plate, with a bevel facing in the direction of the slot.

530,838. Incandescent Lamp. Jacob R. Grove, New York, N. Y. Application filed May 26, 1893.

An incandescent lamp, with a bulb having its neck closed by an independent section of fusible material spanning the neck opening, a vertical tube of insulating material embedded in the fusible section and expanded together with leading-in wires and a filament.



NO. 530,748.

530,839. Automatic Fire Alarm. William A. Guthrie, Durham, N. C. Application filed April 26, 1894.

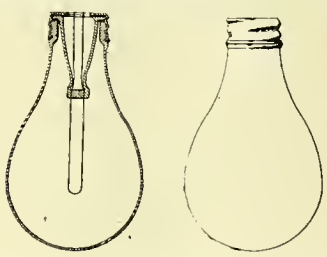
The device comprises a non-conducting base, a spring arm secured thereto, a contact plate also secured to the base, contact points on the arm and plate, a weight suspended from the free portion of the spring and normally holding i out of contact with the plate, a two-part hooked-link forming the suspension medium, an easily fused metallic alloy forming the connection between the parts of the link, and a safety back-stop arm for the spring arm.

530,867. Primary Battery. William Walker, Jr., Birmingham, and Frank R. Wilkins, Handsworth, Eng. Application filed June 4, 1894.

A primary battery having a negative element of carbon forming part of the jar containing the exciting solution, with which one surface of the carbon is in contact while the other is exposed to the atmosphere, and a saucer containing the jar and provided with a discharge, is described.

530,882. Arc Light Hanger Board. David J. Cartwright, Boston, Mass. Application filed January 26, 1894.

The combination with an arc light hanger board provided with hangers, and converging contact springs in e ectrical connection with one of said hangers, of a switch-lever in electrical connection with the other of said hangers and arranged to swing vertically with relation to the said hanger board, and the spring-



NO. 530,882.

actuated plunger co-acting with the heel of the switch-lever to complete the movement thereof in either direction, and reta n it in either of the positions which it is caused to assume, the switch-lever being provided with a heel having an apex which passes from side to side of the plunger.

530,883. Danger Signal. George M. Chace, Somerset, Mass. Application filed March 13, 1894.

In combination, a housing and vertically movable signal hidden from view within the said housing, a wheel, connections between the said signal and wheel, a weight and spring for operating on the said wheel, an audible signal operatively connected with the said wheel, a second wheel located a proper distance from the signal and connected at opposite points with corresponding points of the first mentioned wheel, two sets of levers, each composed of independent parts and having separate connection with the wheels.

530,895. Incandescent Electric Lamp. Edward Kaye, Monaca, Pa. Application filed February 4, 1893.

The accompanying cut shows an incandescent electric lamp, comprising a bulb having a neck, a tubular plug or stopple inserted in it and formed with an outwardly projecting flange, leading-in wire inserted and sealed in the plug and connected to an incandescing filament and a cap or ferrule covering the flange and connecting the bulb and plug together, the cap or ferrule being electrically connected to the filament and adapted to fit into a lamp socket and to be mechanically coupled or interlocked therewith.

## Lighting of the Cook County Criminal Court Building.

The new Criminal Court building of Cook county, at Dearborn avenue and Michigan street, Chicago, is supplied with electric lights, of course, and the current is generated in the basement plant shown in the accompanying illustration. The building is a substantial six-story stone structure, as may be judged by the corner picture, and is devoted to the purposes indicated by its name.

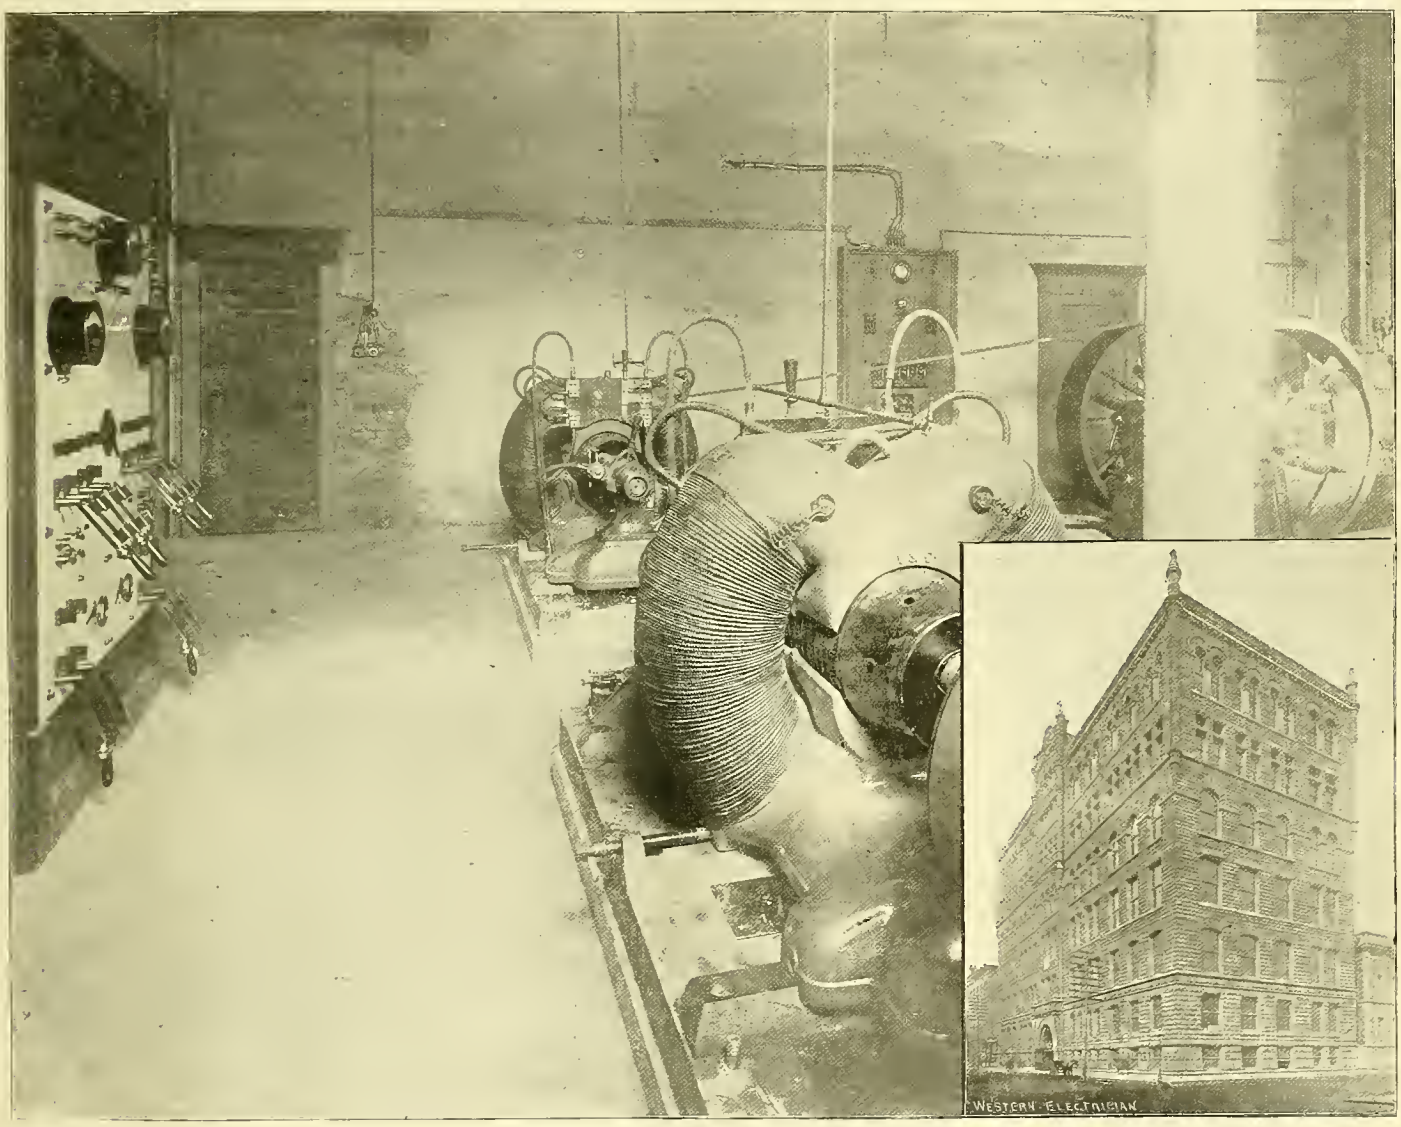
Two Ball engines furnish the power for the dynamos, the steam being obtained from a battery of five tubular boilers of 100 horse power each, equipped with Hawley down-draft furnaces. The boilers are each 16 feet long and 60 inches in diameter. The breeching leads to a brick stack 136 feet high running up the side of the building. About eight tons of soft coal is burned daily, and with this the court building and the adjacent jail are heated, while steam is furnished to Worthington pumps for five elevators—three for ordinary passenger service and two for prisoners—and for cooking and laundry purposes in the jail.

The engines in the lighting plant are each of 100 horse power, with single cylinders, and run at 300 revolutions per minute. Each is directly belted to a C & C 125 volt direct current dynamo of 50 kilowatts capacity. These machines are rated as 800 lighters and are of the usual type of the C & C company. They are operated at 750 revolutions. The leads from the dynamo to the white marble switchboard are underneath the floor. The board is equipped with Weston instruments and the usual outfit of dynamo and circuit switches, including a Cutler & Hammer voltmeter switch.

With the wiring system 1,564 lamps are connected, and the center of distribution is on the third floor. Okonite insulation is largely used.

The building is equipped with the Johnson system for automatic temperature regulation by electrical control, installed by the Chicago Electric Service company, the switchboard for which is shown on the farther wall in the illustration. An interesting feature of the building equipment is the pneumatic time plant. The master-clock is to be located in the basement, and all the other clocks in the building will be regulated from it by compressed air. This will be, it is believed, the first pneumatic clock-regulating plant in Chicago, and its operation, as compared with electrical control, will be watched with much interest.

The plant is under the direction of George W. Wade, chief engineer of the building, and R. J. Campsie, county electrician.



LIGHTING OF THE COOK COUNTY CRIMINAL COURT BUILDING.

## Susquehanna Power Transmission.

From Baltimore comes news of an extensive project to utilize the power of the Susquehanna River for electrical purposes. The report has been given definite shape by the incorporation of the Susquehanna River Electric company. George K. McGaw, John S. Bull and Winfield J. Taylor and other Baltimore and Pennsylvania capitalists are the incorporators. The Westinghouse company is said to be behind the project. The prime object of the company will be to furnish electric power to the street railways of Baltimore, Wilmington and Philadelphia and intermediate towns. The company has purchased eight miles of shore land on both sides of the river, extending from Tidewater to Conowingo, Md. At this point the stream will be turned inland and a large dam constructed. The machinery will have an ultimate capacity of 40,000 horse power. The company will be able to furnish power at less than $80 per horse power per annum. Work will be started on the dam as soon as the spring rains and freshets are over, and it is expected power will be furnished January 1, 1896. Governor Brown, president of the Traction Railway company of Baltimore, and Messrs. Elkins and Widener of the Philadelphia Traction syndicate are interested in the project.

## Down-town "L" Loop for Chicago Apparently Assured.

After much negotiating it is now stated definitely that the agreement to co-operate in using a common down-town loop terminal has been signed by representatives of all the elevated railroad companies of Chicago. After all the formalities had been complied with, Mr. Louderback issued a certificate saying that the "L" roads "had entered into a contract, which was satisfactory to themselves, for the oper-

ation of their trains over the Union Elevated Railroad company's loop, when constructed." No information regarding the route of the belt "L" was given out, but it was stated that the work of getting consents from property owners would begin at once. Electricity will probably be used as the motive power.

## Ornamental Electric Hanging Lamp.

Considerable attention has been given of late to the artistic design and ornamentation of electric hanging lamps, and many noticeable improvements have been made in this line. One of the most attractive of this class is illustrated in the accompanying cut, which shows an electric hanging lamp made for the Union Club of St. Louis by the Ludlow-Saylor Wire company of that city. This lamp is made of wrought iron with the Bower-Barff finish, which renders it absolutely rust-proof. The design of the lamp was furnished by the architect, T. C. Link, and has attracted considerable attention.

## Electrical Equipment of the Baltimore Tunnel Railroad.

In the course of a comprehensive article on the Baltimore & Ohio company's electrically operated tunnel railway in Baltimore, the *Railroad Gazette* gives this description of the electrical apparatus:

A contract was entered into with the General Electric company to furnish motors to propel the trains of the Baltimore & Ohio railroad through the Howard street tunnel. Conductors to furnish power are now being placed in the roof of the tunnel. From the masonry lining is suspended an iron trough, supported by Z-bars, containing the conducting wires. The engine will be propelled by combination trolleys, four poles being used. The locomotive consists of a double set of trucks, each having two axles and four driving wheels. On each axle is mounted a 300 horse power gearless motor supported on spiral springs resting on the frame of the truck. The motor fields are of the iron-clad type, each with separate windings imbedded in a mica-lined slot, cut into the curved body of a laminated iron armature.

The axles of the locomotive pass through the hollow shaft on which the armatures are mounted, these shafts resting on the bearings of the motor frame and being connected to the axles by universal couplings, this arrangement of parts allowing freedom of motion in all directions. Each commutator is provided with four sets of brushes, the motors being manipulated by parallel controllers in the cab. The motor can be used for pushing or pulling, and will work in either direction, it being simply a double engine. Each locomotive will have a capacity of 1,200 horse power, and will weigh nearly 100 tons; it will also be equipped with air brakes, and a whistle worked by a small auxiliary motor within the cab. It is expected that these electric locomotives, of which there will be three in use, will develop a speed of 30 miles an hour, and will propel trains over the Belt Line Railroad between Camden Station and Huntington avenue as quickly as could be done by steam.

If a freight train is to pass through the tunnel, the motor will be coupled on behind and will push the train and its locomotive through to Bolton Station, whence the two machines will run the train up grade to Huntington avenue, where the electric motor will be detached without stopping the train. With passenger trains the electric locomotive will couple on ahead, pull the train through to Bolton Station and there leave it, while passengers are getting on and off.

The power house is in process of erection at the south end of the Belt Line below Camden Station. It will occupy the hall square between Henrietta and Montgomery streets, with the side of the building on Howard street. The power house is a one-story structure, substantially built of red brick. It will be 30 feet high to the eaves, 338 feet long on Howard street, and 69 feet wide. The boiler room is separated from the machinery apartment by a heavy brick firewall. It is 69 by 98 feet and space is provided for a battery of 12 Abendroth and Root boilers, of 3,000 horse power. In the engine room will be set up four Allis-Corliss compound engines of 750 horse power each.

The machinery room is 58 by 240 feet in dimensions. The Corliss engines have direct connection with four generators made by the General Electric company, capable of delivering 2,700 horse power. In addition there will be in the boiler room four Armington-Sims engines, each 250 horse power. Two of these will run eight arc machines, each with a capacity of 50 arc lights, and the other two engines will run two alternating dynamos, each with a capacity of 2,000 lights. By means of this enormous light equipment the Howard street tunnel will be made as light as day. The several stations, arches and cuts of the Belt Line will be illuminated at night, ample room being left in the power house for additional machinery.

The excavations and embankments of the Belt Line Railroad are all completed, a small part of the masonry on the retaining walls of the Bolton lot cut remaining unfinished. Tracks are laid over the entire course, but not yet ballasted. The electrical engineers are at work in the tunnel, and workmen are crowding up the walls of the power house as rapidly as possible. Finishing touches are being put upon the bridges and masonry and the greater part of the work will be completed by January 1st. Trains can be run over the line soon afterward, while the depots are building and final repairs to the cuts and embankments are being attended to.

The electric plant and the rolling stock and franchise of the Capital City Railway & Lighting company of Baton Rouge, La., have been advertised for sale in execution of judgment obtained by the Bank of Baton Rouge, the holder of about $40,000 of mortgage notes.

## On the Production of Rotary Magnetic Fields by a Single Alternating Current.[1]

By Ludwig Gutmann.

Since the first announcements of Prof. Ferraris and Mr. Tesla, that rotation can be accomplished by employing two or more alternating currents of displaced phase, the question has been raised by many an engineer as to the possibility of producing a rotary magnetic field by the use of a single circuit, carrying the ordinary alternating current, instead of requiring three or more wires or several independent circuits. So far it has been necessary to construct a special generator armature, the windings of which were rotated in a field of constant polarity, to produce two or more currents lagging in phase behind each other. To use the currents generated for establishing a progressive or rotary field, it was necessary to carry as many wires to the place of consumption as currents were employed differing in phase. Six years have passed, and quite rapid progress has been made in various directions. I wish now to bring to your notice a method of generating a rotary magnetic field by a single alternating current or its field, without condensers or choking coils. This is accomplished by a device brought out by me some three years ago. Its fundamental principle is hardly as yet appreciated; however, the World's Fair exhibits as well as literature of late show that the device has attracted attention, and that several engineers have approached the principle involved.

I wish to refer to my motor and especially to its armature described in 1891.[2] Figs. 1 and 2 show the device. The former is principally used in the American patents, while the latter is given in the English patent of the same year. The

ORNAMENTAL ELECTRIC HANGING LAMP.

novelty of the armature construction lies in a winding containing closed sub-circuits; and another point is that the closed circuits do not coincide in number with the poles of the field magnet. Before going into the action of this device, I will mention two simple experiments which are essential in order to understand the operation of this rotary magnetic field system.

If we have a closed coil moving in an alternating magnetic field, or better, between the poles of a field magnet as illustrated in Figs. 3 and 3*a*, energized by alternating currents, then the coil *A* will be repelled from the pole, owing to the secondary field which it establishes, so long as it cuts, or is threaded by the lines of force of the field. The consequence is that it will rotate, and place itself between the north and south pole, Fig. 4, where it reaches a stable magnetic equilibrium, as I like to term it, because in this position it acts like a pendulum properly suspended, Fig. 5. Any motion imparted causes the pendulum to make a few oscillations and come to rest, and similarly any attempt made to move the coil into an energized field will cause it to be repelled, and after a few oscillations it will remain at rest between the poles. It is repelled in either direction, because as soon as it approaches a strong magnetic flux, currents are induced in its windings and create an opposing field. The same coil can be in unstable magnetic equilibrium, Fig. 6, if it stands just in front of a pole, in which position it would act like a pendulum which is balanced with the weight above the point of support, Fig. 7. Both are in unstable equilibrium; the least motion to the left or right imparted to either will cause them to accelerate in the direction of the impulse, and to assume a position of stability, Figs. 4 and 5. In this position, Fig. 4, the coil is therefore currentless. This stable position is the natural position of synchronous motors in operation.

If such a synchronous motor is held behind the phase when rotating under load, a heavier current is induced in the spools which accelerate the armature and keep it in step. If, however, the motor runs in harmony, and suddenly a great deal of the load is taken off, then the armature has a tendency to go more quickly, but in this case opposing currents are generated in the windings which retard the speed of the armature and keep it back, to remain in step, or in stability.

Let us look into the device before us, and consider first its quality as a motor. Returning to Figs. 1 or 2, preferably the latter, which is simpler and easier to explain, we find that if we send into the field magnet coil an alternating current, the armature will turn through a certain angle and stop. This motion depends upon the position of the three closed coils with respect to the two poles. This same device can itself be self-starting if we make the poles far enough apart and the energizing current sufficiently strong, so that at the initial speed the armature is repelled at a certain rate. This initial speed changes with the number of poles, closed circuits and alternations. Let us take the first case and examine it. If we try to rotate the armature (as I shall call it hereafter) in a field of alternating polarity, we induce currents in the closed circuits, which establish poles, but these poles are alternating in nature, and owing to the motion imparted, and owing further to the permanent connections in the winding, the poles move or travel with the latter. This accounts for the fact that if the field poles are close together the armature consumes power during its rotation through the alternating field; it acts as a dynamo and does not start from a state of rest. If we impart by mechanical means an impulse to the armature, currents are generated whose sum has a variable and principally negative value. The armature makes a few revolutions and places itself in a stable magnetic equilibrium, viz., in such a position, symmetrical if possible, as not to generate any currents, and hence not to induce any reactionary[1] poles in the core. If, however, we impart to this armature a certain initial speed, which I shall call the critical speed, then it will continue to rotate, with a tendency to reach a certain fixed higher speed. This initial impulse may be given by mechanical or electrical means. I shall not state the results as yet, but prefer to explore the action first, so that the same may be before us in various diagrams, and enable us to make any deduction desirable. First, let us assume that the armature rotates synchronously. It is evident that in order to have an armature with three close-circuited coils, interconnected as shown, rotate in one direction, we must have currents induced whose sum has a positive value, viz., two of the coils must do work, in the same sense, while the third coil is either without a current, or has a smaller current in opposite direction, so that the value still remains positive. For true synchronism a close-circuited coil reaches within a half period the opposite pole, and consequently our diagram for one revolution would appear as shown in Fig. 8.

The three diagrams, *a*, *b*, *c*, show the flow of currents and resultant poles. The close-circuited coil *2*, diagram *a*, is at this moment generating opposing currents to the others; coil *1* is passing just in front of a pole. All three induced currents combined are developing poles as indicated, and rotating the armature in counter clockwise direction. The rotation being synchronous, diagram *b* shows the position of the armature when the polarity in the field has reversed; diagram *c* gives the position of the coils after the polarity has changed again. It will be noticed that the original position, as shown at *a*, has been reached again, and that the cycle will repeat itself. Without explaining these diagrams at this point, I wish to bring before you several other conditions, all of which will assist in reaching definite conclusions. Looking at the armature we see that it has a symmetrical winding, and as long as these closed circuits do not coincide with the number of poles of the field magnet (contrary to all synchronous motors built heretofore), other working positions are

1. Read before the American Institute of Electrical Engineers, December 19, 1894.

2. *Electrical Engineer*, vol. xii., August 26, 1891, p. 230.

1. It is well to call the armature poles due to the armature currents reactionary poles. The other armature poles are induced directly by the field poles, and contribute nothing to the torque.

possible. The operation will take place as long as the sum of the armature currents has a positive value, since as far as the rotation is concerned it is indifferent which of the coils are doing the work. Let us assume that the armature does not run at a synchronous rate, but at another fixed speed which may have a certain commensurable relation to the periods of the exciting field current, which speed I shall call the harmonic speed. Instead of showing the diagram with windings as in the first set, I have simplified them. In the following sets of diagrams, Fig. 9, I assume that the armature, on account of the load or other reasons, cannot reach synchronism, and that at each field reversal the position of the armature with respect to the field is the same, only the coils have changed places as indicated. You will notice that in this set of diagrams the armature, for each half-period, makes one-third of a revolution only, namely coils *1*, *3* and *2* exchange positions with the change of polarity. Let us step at once to another speed, Fig. 10, which you will no doubt admit as possible, viz.: Let us assume that coils *1*, *2* and *3* cannot arrive at synchronous speed, and that coil *2* reaches the position which *1* ought to occupy, it will be seen that owing to the symmetrical position, it is quite indifferent which of these coils arrives at a given position required for

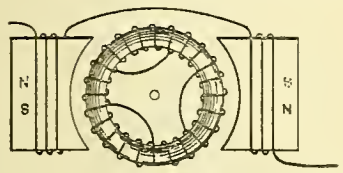


FIG. 1. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

harmonic operation. This will be clear to you by referring to the third set of diagrams, Fig. 10.

We are now enabled to compare three sets of diagrams, Figs. 8, 9 and 10. The first set shown for this new type of synchronous motor that at synchronous speed the pole positions in the armature are practically stationary relatively to the coils and core, and rotate with it. The second set shows that during a complete revolution of the armature, the field has reversed three times, that is, an odd number of times, hence, when the armature returns to its original position, after a complete revolution, it finds the field magnetization of reversed polarity. The magnetic field of the armature rotates in the opposite sense, one and a half times per revolution. In the third set, the armature makes but one-sixth of a revolution per half-period, and the magnetic field of the armature in a complete revolution rotates three times in the opposite direction. This statement may be startling, and my argument, so far, may not be entirely convincing, as on close inspection it will be found that the armature poles have to do considerable jumping. I will now explain the performance of the rotary magnetic field of this armature in a four-pole field, where the changes occur far more gradually, leaving no doubt whatever as to the assertion made. Fig. 11 shows diagrams illustrating synchronous speed. By the aid of these four diagrams we can more easily follow the pole positions in the armature core, and find them stationary in it. Inspecting now Fig. 12, in which the armature speed is reduced, we are able to obtain a clear picture of the main subject under consideration.

In this set of five diagrams we see five positions, which coil *1*, for instance, occupies before it has made one-third of a revolution. Nevertheless, if we now look at the changing pole positions we can readily detect that they are progressively shifting and we also see that they have made one whole revolution and that in opposite direction to the mechanical rotation, or, in other words, the magnetic field would travel three times around the armature core during one revolution. In all armature diagrams described and to be described, the resultant of the magnetomotive forces of the armature currents is given only. To complete the picture showing every one of the component magnetomotive-forces acting, it becomes desirable to plot a diagram of force, Fig. 13. These components act like three variable concurrent forces including an angle of 120 degrees with each other. These forces we may represent as equal, for the sake of convenience, as it does not influence the idea which we wish to

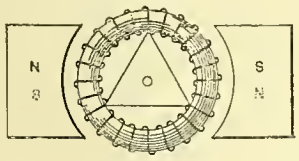

FIG. 2. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

illustrate. However, those two forces which are acting in the same direction are indicated by heavier lines.

Plotting the direction of the forces in order, as, for instance, in the last named set of diagrams, Fig. 12, where the coils act in the order *1*, *2*, against *3*; *3*, *1*, against *2*, and *2*, *3*, against *1*, we obtain Fig. 13 for one cycle. The three figures marked *a*, *b* and *c* indicate the direction in which the three forces are acting in the three positions of one cycle or revolution.

By drawing the resultant diagram of force from the predominating forces of each position, we obtain the accompanying illustration, Fig. 14. These forces form a triangle and the rotation resulting may be seen from the direction of arrows on the circumference of the surrounding circle. However, the reactive forces should be considered and represented separately to obtain the true picture and we have to add them to find the total force applied and the manner in which all the forces are acting. We therefore repeat the resultant diagram, Fig. 14, and add the opposing forces at their proper places. This diagram, Fig. 15, shows that the reactive forces, shown by dotted arrows, also have a common center, and that, as regards time of maximum effect, they succeed each other in the direction of rotation of the armature, while they are acting in the opposite direction of the main force. If we now plot a diagram of these reactive forces alone, we obtain the smaller triangle shown, Fig. 15, inside the larger. It will be noticed that rotation is in the opposite direction; or, in other words, that in reality we have, with this disposition, to deal with two rotary magnetic fields in opposite direction; the useful work done will depend on the difference of the angular velocity of these two rotating fields and their relative intensity.

Looking now at the device as a generator, Fig. 12, we can account for the rotary magnetic field because we generate polyphased currents in the coils *1*, *2* and *3*. They operate together in the following order: *1*, *2*; *3*, *1*; *2*, *3*; *1*, *2*, etc. If rotated, as shown, the coils will distribute three-phased currents over the armature, and this will be understood when examining into the flow of currents of the close-circuiting conductors which are here provided with arrows. At this particular harmonic speed, it will be further noticed that the simple alternating field of force has the identical qualities as a polyphase energizing field, as the poles in front of the close-circuited coil seem to be traveling (for the armature) in clockwise direction. This is indicated by the shading of the pole of same sign in front of the coil most powerfully acted upon in the five positions, representing one revolution for the field. The currents displaced in phase cause the armature to rotate harmoniously with the alternations, and prevent the armature from being easily thrown out of step.

Returning once more to the earlier diagrams, Figs. 9 and 10, we see that below synchronism there are two other speeds which are entitled to be called synchronous, because a certain fixed relation exists between the periods of field excitation and armature rotation.

It will be evident that the greater the number of closed circuits, the greater is the number of harmonic or synchronous speeds in which the armature can operate. If the armature contains ten closed circuits, and rotates in a two-pole field, it will be able to generate five currents, lagging 72 degrees behind one another in phase, and would have at least five speeds which are synchronous, and the armature, owing to its peculiar construction, can operate at a slower speed than the synchronous speed as interpreted heretofore.

Looking at the device from a general standpoint, it will be clear that this particular armature construction embodies all

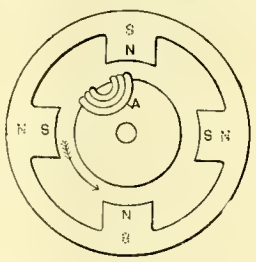

FIG. 3. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

the weak points of a synchronous, and all the strong points of the polyphase motor. The weak points are:

1. That the machine will not start from state of rest in the form shown, because in Figs. 1, 2 and 12 the coils act on one another differentially and have a variable and negative value; they are in magnetic stability when at rest, hence no rotation can result.

2. The device has a small starting torque when rotated, owing to the differential action of the coils, which cause, with a small number of closed circuits, strongly oscillating or jumping poles, until a harmonic speed is reached.

3. The device, when in rotation, is not reversible by simply changing circuit connections.

The strong points are:

1. That the motor develops polyphased currents in its own windings.

2. That therefore it is more difficult to pull it out of step, as it has the capacity to stand, what I would term, magnetic slippage.

Let us assume that a certain coil, which should reach a given point to run harmonically, remains behind, owing to a slower motion of the armature; in this event the coil ahead has to perform the function at the expense of a heavier current. The loss of revolutions due to this action may be comparable to the slipping of a belt over a pulley. However, there is also a limit to the slipping. The armature should have some harmonic speed with respect to the alternations. Should it fall below the lowest harmonic speed, then it will come to a standstill just like any other overworked synchronous machine.

Synchronism in a motor means nothing more or less than a magnetic flexible clutch, which may be represented mechanically as follows:

The old-fashioned non-starting synchronous machine having equal armature coils and field poles can be compared with the arrangement shown in Fig. 15*a*, giving side view and elevation. The disk *1* is provided with two projections; *2* imparts rotation to shaft *4* by means of the flexible arm, or spring *3*, which enables the shaft *4* to be slightly behind or ahead of disk *1*. However, if the work put on shaft *4* is in excess of the strength of spring *3*, then it will break, and shaft *4* will speedily come to a standstill.

In contrast to this older form of synchronous motors stands the new one, which forms the subject of this paper and the machines operated by bi- or polyphased currents. The mechanism for showing magnetic coupling for these latter types may be represented by Fig 15*b*. In this case, *1* represents a crown wheel, the teeth marked *2*; into these teeth meshes a catch *3* in a flexible manner, which catch is connected rigidly to shaft *4*. Within the range of normal work, catch *3* would remain fixed between the two given teeth, but if the shaft *4* is overloaded, the flexibility of catch *3* will cause it to yield, and pull out of its position, drop in between some other two teeth, and continue to operate, but at a slower speed. The greater the excess of work, the greater will be the slippage, and the more teeth will be jumped by the catch *3* in every revolution of disk *1*. For the synchronous motor herein described, the overloading to the extent that it cannot reach the lowest harmonic speed would be equivalent to the breaking of spring *3'*.

It will be remembered that Prof. Ferraris obtained a rotary magnetic field and rotation by influencing one coil carrying a primary current by another at right angles thereto carrying secondary currents. Here we have two phases from a single source, Fig. 16. To obtain a multiple of phases we may take two or three iron cores *A*, and surround them with coils *B*, like the links of a chain, Fig. 17, so that the secondary coil of transformer *1* is the primary of transformer *2*, and so on; or we may design a special core for a transformer, and create a rotary magnetic field by applying to one coil a primary current from the line, and to another coil a secondary current from a transformer, whereupon, by the rotary field obtained, polyphased currents may be taken through other coils on the transformer. These methods have, however, one drawback, and that is that the phase will change more or less in lag with difference in load, while for many purposes it is

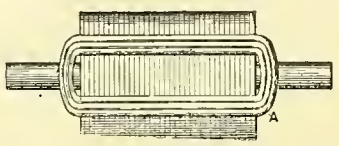

FIG. 3*a*. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

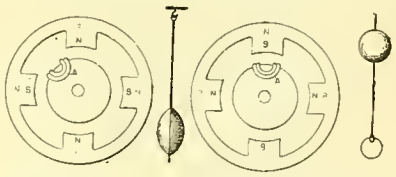
most essential that for efficient working the phase should remain at the same constant angle. This desideratum has been accomplished by the device under consideration, and any suitable number of currents lagging in phase may be obtained from a single alternating current.

To obtain a rotary magnetic field in or by a stationary body, at least two electric or electromagnetic forces of definite phase relations, acting at an angle to one another and changing at periods harmoniously, are essential requirements.

If, however, we allow the body, or part of the same, to be movable, we may substitute mechanical rotation primarily as an adjuster of the periodicity and phase of one of the two forces; the fundamental relation between the two forces must in this case also be the same as in the other; namely, they must work in harmony and the periodicity and phase determines the periodicity and phase of the other of one force. If the second force is a current, it must be one of the same period or some harmonic of that period; if it is rotation, it has also to be synchronous or harmonic. We can now clearly understand why, when rotating the armature, Figs. 1 and 2, in an ordinary alternating current field we have no system of polyphased currents and no rotary field, simply because the armature rotation does not stand in any relationship whatever to the alternations; but as soon as the speed does so, there are generated polyphased currents lagging in phase at a fixed angle and a rotary magnetic field.

There is a difference whether the armature is influenced by a single alternating current, or by several, causing themselves a rotating energizing field. Nevertheless, in either condition the armature is in magnetic stability, and this state is the reason that it remains stationary in the first case, and that it rotates in the second. The reason that the motor starts in the second case is evidently because the inducing magnetic field is itself rotating in the stationary field magnet core. As said before, it is considered necessary for the proper operation of the armature for giving maximum torque, that if placed in an alternating current field of force, the armature rotation should have a definite relation to the alternations. Up to the publication of this device some three years ago, synchronous motors had as many armature coils as field coils, and hence to obtain the value of the synchronous speed, all that was necessary was to divide the alternations of the armature current *n* by the number of field poles *p* of the magnet employed. But if the number of armature coils is not the same as the field poles, then the speed may vary from this synchronous speed and a modification is thought to be necessary. We would have to find the smallest common factor between field poles *p* and armature coils $p^1$ with which we have to divide the number of alternations to obtain the value of the lowest synchronous speed while the condition of slippage may allow for the lowest harmonic the value $\frac{n}{p\,p^1}$.



FIGS. 4, 5, 6 AND 7. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

It will now be clear that motors can be designed having any desired variation of speed and have defined synchronous speeds or approach the indifferent relation. I wish it understood that I do not intend to treat the subject in all its details, and I am especially reluctant on the ground of having carried on but few experiments.

The few diagrams presented do not disclose many conditions of those possible. They show only one or two facts of conditions which frequently are of a complex nature. Evidently, the rotary magnetic fields in the device under consideration may have altogether different speeds from those shown in the diagrams; also, that the magnetic field may rotate with and ahead of the armature, and, lastly, the speed

of rotation of the rotary field of the armature may be synchronous and opposite in direction to its rotation.

The device has been given in form of a diagram, and as it has been described as not self-starting I wish now to state that it becomes self-starting as a series, a shunt or an induction motor in a field of single phase or polyphased alternating currents. Fig. 18 represents one of the earliest forms which have since been simplified to a considerable extent. The part *A B* represent here a simple series motor whose armature *B* may be any drum or ring type open or closed coil winding; the part *C D* may be similarly constructed. Both armature windings *B* and *D* are connected electrically by four wires *E* at points of equal distance, which number of conductors *E* may be reduced or increased, depending on the number of phase currents desired. Now send an alternating current into the series motor, part *A B*[1], then the armature will start from state of rest and will send current impulses into the *D* part winding, which becomes the more regular the more the armature has approached synchronous speed, where bi-phase currents will be established therein; these react on the field magnet core *C*, and for the purpose of maintaining the armature in this synchronous speed the commutator *F* is applied to rectify

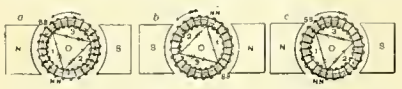


FIG. 8. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

the polyphase currents, which continuous current may be used to energize the magnet *C*.

The fundamental principle disclosed opens to us a very wide field for work. Not only are we enabled to construct motors almost as cheap and simple as continuous current motors, but there is in this principle involved the germ for the ideal distribution of power, inasmuch as we are enabled to collect the polyphased currents generated or commutate them immediately at will.

Finally, I wish to call your attention to the fact that the last figure is in reality a motor-generator, and it is therefore evident that the electrical energy supplied need not all to be transformed into mechanical power, but that a portion may be utilized in one of the modified forms named above.

## Berliner Patent Decison.

Following is the full text of Judge Carpenter's opinion in the Berliner case, announced in the last issue of this journal:

This is a bill in equity praying the repeal of Letters Patent No. 463,569, issued November 17, 1891, to Emile Berliner as assignor to the American Bell Telephone company for combined telegraph and telephone. The first ground of the bill to which I shall refer is that the patent is void as being beyond the power of the commissioner to issue, in view of the issue of a former patent, No. 233,969, issued November 2, 1880, to Emile Berliner for electric telephone.

The patent of 1891 is for a transmitter for a speaking telephone. The fourth claim of the patent of 1880 is as follows:

4. A system of two or more telephone instruments in electrical connection with each other, each consisting of two or more poles of an electrical circuit in contact one with the other, either or both poles of each instrument being connected with a vibratory plate so that any vibration which is made at one contact is reproduced at the other, substantially as set forth.

This patent is, therefore, for the "system" or combination of a transmitter and a receiver for a speaking telephone. The whole apparatus is shown in the drawings of both patents and is identically the same in both. The transmitter and the receiver are identical in form and differ in function according as they are placed at the transmitting or at the receiving end of the telephone wire. It, therefore, appears that one of the functions of the device shown in the patent of 1880, namely, the function of transmitting articulate speech, is identical with the sole object or function of the device covered by the patent of 1891 and that the device for effecting the transmission is identical in both patents. The patent, therefore, seems to me to be void and beyond

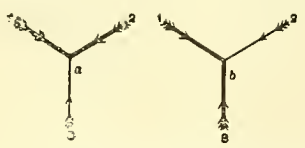

FIG. 13. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

the power of the commissioner to issue. (Miller v. Eagle Manufacturing company, 151 U. S., 186.)

The second ground of the bill is that the issue of the patent was unlawfully delayed through the fault of the respondents. The respondent company were the owners of a patent previously granted to Alexander Graham Bell, which covered the art of electrical transmission of articulate speech. The device of Berliner, as both parties in this case agree, covers the only commercially practicable and useful method at present known for effecting such transmission. In this state of facts, the claim of the complainant under this bill is fully and briefly stated by counsel in the following words:

"The proposition is that the Bell company intentionally delayed the prosecution of the Berliner application and the issue of the Berliner patent for the purpose and with the result of prolonging their control of the art of telephony, which would cease with the expiration of the Bell patent in 1893, and that they did this by submitting to delays on the part of the officers of the Patent Office, which delays they, the Bell company, had it in their power to prevent, and refrained from preventing, for an unlawful purpose. This conduct is alleged to constitute a fraud practiced upon the public through the commissioner of patents and his assistants. And it is claimed that the patent so obtained by such fraud may be and should be annulled by the decree of the court, on the authority of the United States v. American Bell Telephone company, 128 U. S., 315, because there is no substantial difference between fraud practiced upon the commissioner as an agent of the public, and a fraud practiced upon the public with the commissioner's connivance or acquiescence."

The application for the patent was filed June 4, 1877, and the patent was issued November 17, 1891. The patent to Bell expired in March, 1893. The device covered by the patent in suit had been in public use by the respondent corporation since the year 1878. The respondent corporation was of ample means to prosecute the application. The result of any delay which might take place in the issue of the Berliner patent would evidently be to continue so much longer the practical monopoly of the art of electrical transmission of articulate speech. Under these circumstances, I think it clear that the duty of the respondent corporation was to use the greatest degree of diligence in prosecuting the application to an early issue. There should have been, at least, as great diligence as their own interests would have called for, had their business been unprotected by patent rights.

Thus far there is no dispute between the parties here. It is admitted that the greatest diligence was incumbent on the respondent corporation, and that if there be unlawful delay and if there be bad faith and an intention to delay on the part of the applicant, then the patent may be here held to be void.

From the filing of the application up to June 9, 1882, it is not contended that there was any delay upon which a decree here should be founded. There were delays in prosecuting the application, but they are said to be no greater than is usual in the Patent Office. On the date last given the solicitor in charge of the application was notified by the examiner that "as at present advised, it is believed that the claims presented may be allowed, but final action in this case must be suspended in view of probable interferences with other pending applications."

In October, 1883, the solicitor wrote to the office asking that the case might receive attention, to which it was replied that the apprehended interferences had not yet been declared, and the correspondence was continued in the same sense until March, 1888, when the application was suspended until May 1, 1888, on the ground of the expected interferences, and also "for the purpose of awaiting the

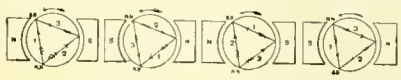

FIG. 9. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

determination of the telephone cases in the Supreme Court."

The application with which an interference was anticipated was that filed July 26, 1880, by Daniel Drawbaugh, in which he claimed to be the original and first inventor of the telephone. His claims were rejected on the ground that the instrument which he claimed to have invented had been in public use and on sale for more than two years before the filing of his application. He had filed an affidavit in which he denied that there had been such public use with his consent and allowance. There was abundant evidence on file in the Patent Office by which was shown the fact of public use as early as July 26, 1878. It had been declared in Manning v. Cape Ann Isinglass & Glue company, 108 U. S., 462, that the statute then in force did "not allow the issue when the invention had been in public use for more than two years prior to the application, either with or without the consent or allowance of the inventor." The case was then pending of the Bell company against the People's Telephone company, owners of the alleged telephone inventions of Drawbaugh, in which was involved the question whether Drawbaugh had in fact invented the telephone at the early day claimed by him, or whether on the other hand his claim was entirely false. Under these circumstances there was set on foot a "general understanding" as it is called, on the part of the examiner and the respective counsel for Drawbaugh and for the Bell company, that the decision of the application for the Berliner patent should await the decision of the pending suit. There seems, on the testimony, no doubt that the Bell company fully acquiesced in this general understanding; and I think that in so doing they failed in their duty and committed a wrong against the public.

It was evident that in no case could Drawbaugh be entitled to a patent. He was clearly barred by the prior use of his invention. On the other hand it is to be observed that the action against the People's Telephone company might not be finally decided for many years and that when decided it would not necessarily throw any light on the question then pending in the Patent Office; namely, whether Berliner or Drawbaugh was the first inventor of the microphone transmitter. The suit was for infringement of two of the early patents issued to Bell, the first for the electrical transmission of sound, and the second for a receiver. The answer denied the validity of the patents, alleged anticipations and further averred generally that Drawbaugh was the first inventor of the speaking telephone. The invention of the microphone, a particular form of the speaking telephone, was therefore not in issue. The case made by the People's Telephone company, indeed, as was well known, was that Drawbaugh had invented the whole telephone system, as it was then known, including the microphone, long before Bell's invention. If this were found to be the fact, then, of course, it would follow that he had anticipated Berliner as well as Bell. But, if this were found not to be the fact, that finding would throw no light on the question whether Drawbaugh had or had not invented the microphone subsequent to Bell and prior to Berliner. It could never appear in the Patent Office, therefore, that Drawbaugh was entitled to a patent; and only in one aspect of the telephone case could it be decided that Berliner was not entitled to a patent. The plain duty of the respondent corporation, as it seems to me, was to press these considerations in the Patent Office and insist on its right to a patent at once, leaving the question which was pending in the courts to be settled whenever a final decision should be reached and leaving the decision of that case to have whatsoever effect it lawfully might on the validity of the patent. The commissioner on such an application might properly have been asked to take proofs, on notice to Drawbaugh, so as to ascertain *prima facie*, and with sufficient certainty for the purpose of an administrative decision, by whom the first invention of the microphone had been made. It would well have been urged on him that it was his duty to make such an investigation of a question which was not in issue in the pending suit and

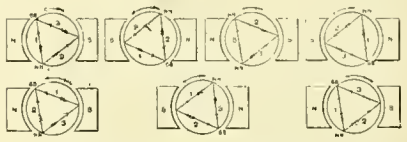

FIG. 10. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

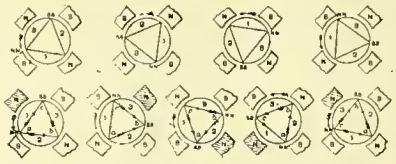
which the decision of that suit might furnish no guide in determining.

It is objected that there was no established practice in the Patent Office by which the question of priority of invention could be ascertained, and that for other reasons such an application to the commissioner had no prospect of success. It seems clear to me that the duty of the respondent corporation was to test these questions rather than to consent that they must be decided against them—for an acquiescence in the delay seems to me to be no less than a consent that no favorable result would come from the application.

That the unwarrantable delay thus caused was intended by the respondent corporation I can have no doubt. In matters of this consequence, involving the whole business of a company of so large capital and engaged in so large affairs, I cannot doubt that they were fully advised both as to the facts and as to the law; and I think "that their acts were so gross as to forbid any inference except that they dishonestly delayed" the issue of the patent, taking advantage for that purpose of the perhaps excusable willingness of the officials of the Patent Office to postpone the decision of a sharply debated question, in which a large public interest was involved, on the chance that a decision of the Supreme Court might supersede the necessity for a decision on their part.

In March, 1888, a final decision was rendered by the Supreme Court in the action against the People's Telephone company, and the claim of Drawbaugh to the invention of the telephone was held to be unfounded. In June, 1886, the examiners in chief of the Patent Office had decided that Drawbaugh's application was barred by reason of two years' public use of the invention, and the time for an appeal from this decision expired in June, 1888. The commissioner then set on foot a proceeding to determine whether in fact there had been a public use of Drawbaugh's invention for two years before the date of his application, and the Berliner application was still suspended to await the result of an interference which might be declared in case Drawbaugh should prevail in the public use proceeding—the rule of the Patent Office being that no interference could be declared unless in cases where the interfering applicant, if successful in the interference proceeding, would be entitled to a patent. This public use proceeding, whose purpose is to permit the applicant to be heard on the question of public use when that question has been raised by the office, was strenuously objected to by Drawbaugh, who took no evidence in the proceedings. In October, 1891, the proceeding came to an end by a final decision of the com-



FIGS. 11 AND 12. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

missioner to the effect that Drawbaugh was barred by the prior use of his invention. On the next day the Berliner patent was ordered to issue "largely because well settled principles of public policy forbid us to give any further opportunities for holding this application in the office."

There was no effort, so far as I can see in the evidence, on the part of the respondent corporation to prevent this further delay. There was ample evidence before the commissioner of the fact of prior use; the applicant, Drawbaugh, declined to take evidence in contradiction; and it seems to me clear that the respondent corporation should have urged upon the Patent Office a decision on the *prima facie* case which they had made.

I am persuaded that the delay thus caused, as well as the delay previous to the decision of the Supreme Court, was intentionally acquiesced in by the respondent corporation for the purpose of delaying the issue of the patent. This seems to me the only conclusion from a consideration of the whole evidence. It is in proof that during the whole of the time, from 1882 to the issue of the patent, and perhaps earlier

[1] preferably so that no reaction takes place from part *D*.

the solicitors of the Bell company were urgently insisting to the officials of the Patent Office that prompt action should be taken in the application. Even while the "general understanding" was in force to the effect that the application should await the decision of the Drawbaugh case in the courts, the evidence shows that these urgent applications were made to the Patent Office officials. I cannot think that it was by anyone expected that such oral applications should have any effect, unless, at least, they were made in support of formal applications made on the record and of formal arguments and representations made in support of such applications. The officers of the company also testify that at all times they were urgent in pressing for the issue of the patent. As to their state of mind and their actual intention at the time, I am free to say that I place less reliance on their statements now made than on a single statement made at the time. In February, 1886, while the "general understanding" was in force, Mr. Swan, one of the solicitors for the application,

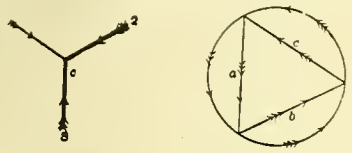


FIG. 14. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

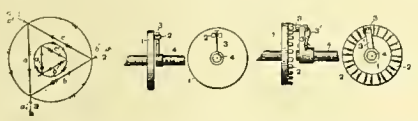
wrote as follows to the president of the Bell company: "I am working the Edison and Berliner cases along quietly and think they will be granted by the examiner without interferences or appeals, so that we can take them out by paying the final fees. We have six months to do that in." This is but a single paragraph out of many hundreds of pages; but I think it shows clearly what was the purpose of the respondent corporation, consciously formed by their officers and perfectly understood by their agents at the Patent Office. The application was to be "worked along quietly," although apparently pushed with great energy; there would be delay, but no substantial obstacle to the grant of the patent; and even after the patent should be ordered to issue there might be a further delay within the limits of the law and without imperiling the patent. If this letter does not mean this, I am at a loss to know what it does mean.

My conclusion, therefore, is that the complainant has made out the case and that there should be a decree that the patent in question is void and shall be delivered up to be cancelled.

The decision annulling the Berliner patent excited the greatest interest in all parts of the country. Lawyer Frederick P. Fish, the eminent counsel for the Bell Telephone company, speaking of the decision rendered by Judge Carpenter, said: "The case will now go the United States Court of Appeals, and a decision will possibly be rendered next spring, after the case has been argued anew, as though the Circuit Court had not made this decision. If the case is decided against us it will be taken to the United States Supreme Court."

The case was argued from June 14th to the 20th. The government's special counsel were Causten K. Brown of Boston and Robert S. Taylor of Fort Wayne, Ind. The telephone company's counsel were Chauncey Smith, J. J. Storrow, F. P. Fish and C. H. Swan. The costs in the case are enormous, the record alone making two large printed volumes, costing over $3,000. By the court's decree the costs are to fall on the telephone company.

On the New York Stock Exchange the effect of the decision of Judge Carpenter was to send down Bell Telephone stock with a rush, and for a few minutes there was great excitement around the Bell pole. The stock had opened unchanged at 200½, and when the news of the decision reached the street it slumped by degrees to 191. From



FIGS. 15, 15*a*, 15*b*. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

this point it recovered to 194, and at one o'clock was selling at 192.

Secretary Patrick S. Egan of the Harrison company said: "The decision rendered by Judge Carpenter against the Bell Telephone company declaring its Berliner patents void practically ends this great monopoly. The Bell Telephone company has lorded it over the public for a number of years, and, not satisfied with the allotted time allowed by the United States Patent Office, it endeavored to extend its patents for another seventeen years. But the United States government would not permit any such proceeding, and this decision gives the Bell Telephone company its just deserts."

President Stone, of the Central Union Telephone company, Chicago, was questioned concerning the telephone decision and replied: "I know no more about the finding of the court than appears in the newspaper dispatches. Whether it will affect the Bell company, from which concern we rent our instruments, is a question I cannot answer. The Berliner patent, which provides for a battery in connection with the transmitter, is in use on the Bell instruments, and this decision appears to be against Bell as well as against Berliner."

In view of the present encouraging telephone situation it is of interest and importance to reproduce a circular issued by the Bell company itself on December 20, 1878. It will be observed that the company at that time spoke very of the comparative merits of battery-transmitter and magneto telephones:

We take pleasure in announcing to our agents, customers and to the public that we are now ready to furnish a battery-transmitting telephone in addition to and to use in connection with our ordinary magneto telephone.

In the magneto telephone the sound waves are thrown against and vibrate a diaphragm which acts as the armature of a permanent magnet, and, disturbing its magnetic field, produces in the helix or coil surrounding the magnet undulatory currents of electricity, which are conveyed over the line and correspond to and reproduce the articulation in the receiving telephone. Any magneto telephone can be used either as transmitter or receiver.

In the battery-transmitting telephone a voltaic current is passed through conductors which are connected to the diaphragm. These conductors offer a certain resistance to the current, and are so arranged that the vibrations of the diaphragm caused by the sound waves vary this resistance with every wave, thus producing undulations in the current, which correspond to and reproduce the articulation. This, however, requires a magneto telephone as receiver.

The battery-transmitter acts more powerfully, for the reason that voltaic electricity is a force much stronger than the magneto electric current when ordinarily produced by the telephone, and on that account the faintest articulation can be transmitted with the utmost distinctness.

It is probable, however, that the battery transmitter will never take the place of the magneto telephone, for the latter is simple in its construction, durable and reliable under all circumstances, can be used for both transmitting and receiving, costs nothing to maintain, is sufficiently loud and distinct and will probably be the most popular instrument for general use.

The battery telephone, though possessing the advantage of louder articulation, and not being liable to get out of order under ordinary circumstances, is more delicate and complicated in its construction, requires the maintenance of a battery in connection with it, the attention occasionally of an electrical expert, and can only be used as a transmitter, thus requiring a magneto telephone as a receiver. It will

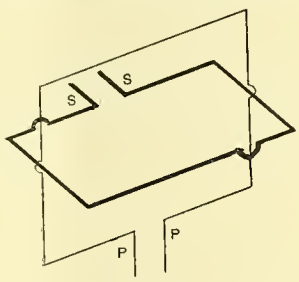


FIG. 16. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

be used principally in the large cities, where the induced currents from telegraph or other wires interfere materially with the weaker currents of the magneto telephone, also in the transmission of messages over long distances, or where, for special reasons, greater volume of sound is necessary to be obtained.

## Lieut. Halpin's Torpedo.

A dispatch from Boston describes Lieut. Halpin's dirigible torpedo and the recent trial at the navy yard. It is explained that the torpedo consists of a thin copper hull, cigar-shaped, with propeller and rudder at one end and a spear-like ram at the other, the forward end. Lieut. Halpin showed the electric motor of four horse power, which turned the propeller and explained how the torpedo itself was wholly independent of the charge which dealt destruction to the enemy's vessel. In the forward part of the torpedo is fitted a metal can or case. When the sphere or harpoon enters an iron net such as a war vessel in these days usually has thrown around it, the meshes of the net strike two projecting arms. This communicates through a rod to a catch inside the torpedo which has held the case containing the charge of 175 pounds of dynamite or a corresponding amount of guncotton or other explosive. The case is released and falls into the water, being suspended by means of a chain from the harpoon head, which becomes detached from the torpedo proper and remains fastened to the net. The charge in the case sinks beneath the net. The contact of the water with a bit of potassium sets on fire a rocket which propels the charge forward and upward so as to rise close against the ship's bottom. The explosion follows within forty seconds of the ignition of the rocket charge. In the meantime the torpedo itself has backed out of way and beyond range of the explosion. It is then free to be guided back to the place whence it started, to be loaded and sent out again.

All this was explained by Lieut. Halpin, who is naturally enthusiastic on the subject, before he turned on the current and set the machinery in motion. The method by which the torpedo is operated and controlled is perhaps the thing most interesting. With nothing in his hand but a ten-inch square board with a pointer and a circle of metal spots and nothing connecting with the torpedo but a small wire weighing only forty-five pounds to the mile, a man can sit or stand on shore or shipboard and by simply moving the pointer on the little board from one spot to another he can run the torpedo at the rate of twelve knots an hour through the water, attack a ship miles away and start the torpedo back to the point whence it started. Just how this is done was illustrated by the lieutenant.

## The Definition of Reactance.[1]

By Prof. H. J. Ryan.

I like the definition of "reactance" as put forth by the authors of this paper.[2] Had we learned to use alternate currents first, this relation between the constant properties of a circuit, the current and electromotive force would first have been understood instead of Ohm's law:

$$\text{Impedance} = \frac{E}{I}.$$

Experience would next have taught us that this impedance relation is made up of two fundamental component relations: the one is a power relation, and the other a wattless rela-

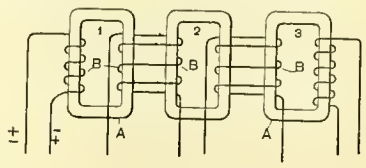

FIG. 17. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

tion. Because of our early familiarity with direct currents we learned long ago to write the power relation as:

$$\text{Resistance} = \frac{\text{power } E}{I},$$

and, now, if we accept this definition of "reactance" the second and equally important component of the impedance law will take the same simple form

$$\text{Reactance} = \frac{\text{reactance } E}{I}.$$

## Government Telephone System.

Bids were opened by the chief clerk of the Interior Department for the construction of a telephone exchange system for the Department of the Interior at Washington on December 18th. The following is a list of the bidders:

Royce & Marean, Washington, D. C., $5,151.01; time, 75 days.

Western Telephone Construction company, Chicago, Ill., $6,165.76; time, 90 days.

Gilliland Telephone company, Chicago, Ill., $5,598.37; time, 90 days.

Gerson Electrical company, Philadelphia, Pa., $2,996; time, 90 days. Bid submitted without guaranty.

Viaduct Manufacturing company, Baltimore, Md., $3,557.50.

## Electrical Fire Department Apparatus in Patent Litigation.

Nathan O. Ross has won his suit in the United States District Court against the cities of Minneapolis and St. Paul for infringing upon the patent of Bragg for electrical and mechanical appliances for releasing horses from their stalls in fire department stations. Judge Nelson filed the order. The suit is one which will attract considerable attention in cities all over the country, as the complainant will probably follow up his suit in other municipalities. Ross is also inventor of a patent appliance for the release of swinging harness. He sued the municipality of Kansas City for infringement and was defeated. But in the suit

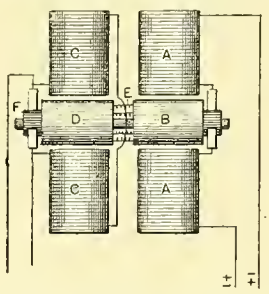

FIG. 18. ON THE PRODUCTION OF ROTARY MAGNETIC FIELDS BY A SINGLE ALTERNATING CURRENT.

against the Twin Cities for infringing the appliance for releasing the stable door, Ross, who controls the patent issued to Bragg in 1876, was successful. Ross has been granted a perpetual injunction in his suit against the Twin Cities and is entitled to an accounting and a reference to a master in chancery to ascertain the amount due. City Attorney Simpson of Minneapolis says that the city will probably have to make a settlement with Bragg under the decision of the court. There are about eighteen engine houses in that city using the appliance.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

CAPITALISTS have great respect for legal decisions, especially those made by the United States courts. That this is true is shown by the fact that the announcement of the decision in the Berliner patent case last week caused an immediate break in Bell telephone stock, a drop from 200½ to 191 following on the heels of the publication of Judge Carpenter's finding. This is all the more noteworthy in view of the fact that the decision is by no means final, and it is fully understood that an appeal will be taken and that all the power and resources of the Bell company will be taxed to their utmost capacity to maintain the validity of the Berliner patent in the higher court.

IN the annual report of his department Postmaster-general Bissell suggests several reforms which he thinks should be instituted. Those grouped under the head of "abuses connected with second class matter" will be of interest to technical societies as well a publishers of periodicals. Mr. Bissell says that so far the publication of fraternal, scientific, educational, trade, professional, literary and historical organizations admitted to the privilege of second class matter, under the act of July 16, 1894, are almost wholly of a mere advertising character, and are, therefore, not of the class to which any exceptional privilege should be given. He believes that the needed reform may be brought about by adopting stricter measures in admitting periodicals. He say: "If it be the policy of Congress to continue the privileges of second class rates to benevolent or fraternal societies, then the remedy I would suggest would be an amendment of the law limiting this rate to them and to legitimate newspapers and legitimate periodical magazines. I believe that one year's experience under such limitations, with the frauds and abuses checked, would demonstrate that we have already reached the time and conditions when all such legitimate newspapers and periodical magazines may be transmitted through our mails from publishers into the hands of subscribers free of all cost."

There is no doubt that societies and educational institutions have abused the privileges extended to them and that newspapers have suffered largely in consequence. It is customary at present to print the proceedings of many scientific bodies, and circulate them among the members and others interested in the special line to which the organization is devoted. In many instances advertisements are printed in these proceedings, thus violating the terms of the proposition which the organizations made when they were endeavoring to get their publications admitted as second class mail matter.

LONG-DISTANCE telephone line installations in Europe are increasing in number. The circuit between London and Paris has been working for some time and is soon to be used in an interesting test of Dr. Gray's telautograph. The line between Vienna and Berlin has been opened, and so large has been the patronage that it is anticipated that a second and perhaps even a third line will very soon be required. During business hours the present line will be exclusively at the disposal of the bourses in the two cities. It is claimed that the present line, which is about 500 miles in length, does not act very satisfactorily. It has been ascertained that the defect is in the line from Berlin to the frontier, whereas the line from Vienna to the frontier works to perfection. While this German-Austrian line is under consideration, it is interesting to note the characteristically English account of the Vienna correspondent of a London journal. This gentleman gossips in this fashion: "Our telephone system would appear to be the best that exists. Whenever an Englishman has watched me use the telephone, his expressions of surprise and delight became quite un-English in their enthusiasm. Not only do we set our watches by the telephone, communicate the latest pun, correct mistakes in pronunciation, but set the boys their work and correct their mathematics on the little desk fixed to the telephone. The ever willing young ladies at the central office often take a lively interest in what is going on, give us pieces of information we might not otherwise obtain, and lovingly ask how we are when we have not called for a couple of days. The telephone in Vienna is perfection, and the connection with Berlin will perhaps have a good effect on the telephone there, which is generally complained of." The idea of calling up a man to communicate "the latest pun" is exquisite.

IN the discussion of Prof. Shepardson's paper before the American Institute of Electrical Engineers, which was published in the WESTERN ELECTRICIAN of December 1st, a number of interesting suggestions are found, although it must be confessed that there were very few ideas of real value advanced. It is quite remarkable that nine men out of ten have no conception of the amount of labor, time and expense involved in the production of an index that would be of any real value to the engineering profession. Admitting the value of a reliable index, it is questionable if the time has arrived when such a work can be begun and carried on successfully. In the first place only a comparatively small number of persons feel the need now of such a work and they would not be willing, if indeed they were able, to support the enterprise. This has been the history of several projects in this line; this drawback is coming to be recognized by those who have given the subject any thought. But it is evident that many of those who discussed Prof. Shepardson's paper gave this feature little or no consideration. One of this class is reported to have made the following suggestion:

Would it not be well for the Institute to undertake the publication of a card catalogue of current engineering literature, including in its scope not only the leading articles in the engineering journals and notices of the papers presented before the various engineering and scientific societies, but also references, in a digested form, of all new books, publications or other matter of importance? The bundles of cards might be mailed at the end of each month.

Such a work as here proposed could only be accomplished properly at great cost and with a thoroughly organized staff of experts. Unless these facilities were at hand the work could not be done properly and would be utterly valueless. Mr. Pope's comments were practical and should be carefully considered. It is not a question of the value of such a work, but the means for accomplishing it. Up to the present time no one in this country at least has solved the problem.

THE subject of providing trolley cars with fenders that will prevent persons struck from going under the wheels, in case of accident, is one that has engaged the earnest attention of municipal officers and street railway men for some time. In Brooklyn particularly, where many unfortunate accidents have occurred—due not to any inherent characteristic of the trolley system itself, but to a peculiarly congested condition of traffic on one or two streets and to the inexperience of the motormen—the agitation for the provision of an efficient fender has been pronounced and widespread. Indeed, the Brooklyn aldermen passed a resolution by which they proposed to create a commission consisting of three of their own number, three representatives of the railroad companies and a seventh man, to be chosen by the six, which should select a type of fender that should be used by all the companies under penalty. This action did not, however, receive the approval of Mayor Schieren, who held, no doubt very justly, that the council had no right to leave the determination of the question to such a commission as was proposed. There appears to be, also, grave doubt as to the legal power of the aldermen to require the use of fenders at all, and especially one of a particular style.

Electric railway men are as eager as any class of citizens—in fact, more desirous, if anything—to throw all possible safeguards about the running of their cars on the surface of the streets in crowded cities. But fenders on the cars have not, up to to this time, proved very satisfactory in practice. The Brooklyn company operating the largest number of cars has, however, adopted a style of gridiron fender which, it is claimed, has done effective work in a number of cases. That a fender can be used which will pick up a person lying on the tracks is exceedingly doubtful at present, since the uneven surface of the streets makes it necessary to place the safety arrangement several inches from the ground. If any device can be provided that will really reduce the liability to serious accident in case a person is hit by a car, the companies should be compelled to make use of it. But at present the chief reliance must be placed on the intelligence and self-possession of the motormen and the pedestrians on the streets.

ASIDE from the direct advantages to be gained by the general public through Judge Carpenter's decision in the Berliner case, should the higher courts sustain his position, there is a distinct and positive gain in the fact that a judge of a United States Court has placed the seal of his official disapproval upon the general policy followed by the Bell company in this matter and has also severely condemned some of its acts. After reading the judge's remarks on the action of the company in allowing the application to be delayed so many years, there can be no doubt as to the view the court took of this policy. He says: "That the unwarrantable delay thus caused was intended by the respondent corporation I can have no doubt. In matters of this consequence involving the whole business of a company of so large capital and engaged in so large affairs, I cannot doubt that they were fully advised, both as to the facts and to the law; and I think 'that their acts were so gross as to forbid any inference except that they dishonestly delayed' the issue of the patent, taking advantage for that purpose of the perhaps excusable willingness of the officials of the Patent Office to postpone the decision of a sharply debated question in which a large public interest was involved, on the chance that a decision of the Supreme Court might supersede the necessity for a decision on their part." Here is a plain statement of fact, and one that will be approved by everybody in the country who is not so deeply interested in the Bell company as to lose sight of the principle involved. But there is another point in this connection which should not be forgotten. Without the consent and connivance of the Patent Office employes or officials the Berliner patent could not have been delayed for such an unreasonable length of time. The judge seems to think that the examiner was reluctant to assume responsibility in deciding the case, but this is no excuse. A public official who is incompetent, or one who shirks rather than perform his duty, should be removed from office. In either case the official could do as much harm as one who was positively corrupt. In fact, if the court is right in the ruling on the Berliner case, the unwarranted delay and final issuance of the Berliner patent was one of the greatest blunders the Patent Office has ever committed. A system under which such practices are possible is essentially defective. In the interest of the public, and in fact in order that confidence may be restored in the department, radical changes should be made at once.

## Theory and Practice in Electrical Engineering.

By J. F. Skeels.

In the issue of the Western Electrician for December 8th there appeared an article on "Theory and Practice in Electrical Engineering," by Rankin Kennedy, containing some very timely thoughts and suggestions, in reference to the three and five-wire systems. The five-wire system, if put up the same as the three-wire—that is, running four dynamos in series—would be practicaly the same, although I believe the practice is to use one machine of 440 volts and a compensator; but the three-wire system is the one generally used, I think, running two dynamos in series and connecting the neutral wire to the junction between the machines.

Mr. Kennedy speaks of serious disturbances occurring upon a slight change of load. Now I have had charge of a continuous current plant during the last seven years. About half that time we distributed by the two-wire system, and our distribution became so bad that we concluded to change to the three-wire. The change was made under the writer's supervision and without the loss of a single night of lighting or changing the details of the wiring in any way, simply dividing the load on the two sides of the circuit by changing one-half of the service line connections. I will say that it was a great improvement over the former plan of distribution. Furthermore, we have had no such disturbances as Mr. Kennedy speaks of. Our difference of load varies from 0 to 20 per cent. of full load, without causing any fluctuation in pressure, and we have no such fluctuation in pressure as spoken of, nor any such rules. My experience leads me to say that no matter how great the difference of load there will be no serious disturbance, nor will there be any great difference of pressure at the dynamos. There may be, however, a big drop in the line owing to the fact that the neutral wire is usually made one-half size of the outside lines, and we also find the running of the neutral back to the junction gives the machines a chance to take care of the difference of load perfectly and they do it. It runs just as nicely as two independent circuits would, and it seems to the writer to be the very best form of distribution where the area to be covered is not too great. The whole country seems to have gone wild over the alternating system, however; but the necessity for transformers and the low efficiency at light loads make the three-wire system preferable wherever practicable. This is not said in a spirit of criticism, but simply giving my experience in the matter.

### Mr. Swinton's Comments.

The following communication from A. A. C. Swinton was printed in the London *Electrical Review*, in which Mr. Kennedy's article appeared originally:

My attention has been called to Rankin Kennedy's article under the above heading, in which he instances Scarborough among places where the adoption of the alternating, in lieu of the continuous current system, cannot be justified.

As chief engineer to the Scarborough Electric Supply company, I must point out that Mr. Kennedy appears to be altogether unfamiliar with the local conditions obtaining in that popular seaside resort.

The municipal area, within any portion of which my company can be called upon to supply electricity, contains some four square miles. It is most irregularly shaped, with an extreme length of nearly three miles. When the company was formed, about two years ago, the best positions for the supply station were most carefully considered. Only three sites in the least suitable were to be found—one, the most central, so far as the business quarter of the town was concerned, was nearly two miles distant from one extremity of the borough, and about 1¾ miles from a point to which we are at present supplying current. This site was also unsuited for cheap access of coal, and in other respects disadvantageous. The second site was even more eccentrically placed, was not large enough for the ultimate requirements, and had other disadvantages. The place finally selected, and now used, is not very far from the center of the municipal area, is near a railway siding for coal, and affords facilities for water for condensing purposes. It is, however, a mile distant from the center of the district where most of our consumers are located, and about two miles (measured along the line the mains have to go) to our present most distant point of supply.

Now, at the present moment, we are supplying the equivalent of 10,330 lamps of 8 candle power. We have spent altogether, including the freehold purchase of two acres of land, the making of a large condensing pond, the erection of buildings sufficient for a much larger output than we have at present, and for machinery, mains, meters, transformers, accessories and formation expenses, about £25,000. We are thus capitalized at less than £2 10s. per 8 candle power lamp connected, which, in any case, would be a very low figure, and especially so when it is borne in mind that we have laid over seven miles of mains, of the most substantial description, and on a scale that will admit of a large increase in the number of lights supplied.

In the light of this information, I do not think that any competent engineer will agree with Mr. Kennedy's view that Scarborough is a place suited for the low-tension system, a view which it seems to me he must have put forward without a sufficient knowledge or consideration of the local circumstances.

In any case it would be interesting to know how he would arrange to supply our consumers on the low-tension system at anything like our low capital cost.

## Important Legal Decision.

The litigation between the city of Chicago and the Hyde Park Electric Light & Power company and the Mutual Electric Light & Power company involved an interesting legal point that is of considerable importance to electric light and power companies furnishing current in prescribed territories. The point at issue is clearly presented in Judge Shepard's opinion in reviewing the case on appeal from the Circuit Court of Cook County, Illinois, which is herewith appended:

The Mutual Electric Light & Power company exhibited its bill for injunction against the appellant, and in the same suit the Hyde Park Electric Light & Power company, which was a defendant to the original bill, filed its cross-bill, also, for an injunction against the appellant.

In accordance with the prayers of both bill and cross-bill a temporary injunction order was granted on each. The effect of such orders was to restrain the appellant, its officers and agents, from interfering with the complainant, and cross-complainant in repairing and stringing certain electric wires which had been cut by direction of appellant's officers.

The order of injunction entered upon the cross-bill of the Hyde Park company is the only one that is before us, for the reason, if no other, that the transcript of the record was not filed in this court within sixty days from the entry of the order in favor of the Mutual company (chap. 70, sec. 24, Rev. Stat., entitled "Injunctions").

The Hyde Park Electric Light & Power company was incorporated in 1888 for the purpose of furnishing electric light and power to the inhabitants of the village of Hyde Park, and in 1889, prior to the annexation of that village to the city of Chicago, it was by ordinance given authority to erect and operate a plant for the transmission of electric light, power and heat, in, through or over the streets, alleys and public grounds of said village.

At that time the western boundary of the village of Hyde Park was the center line of State street, south of Thirty-ninth street, and therefore under the ordinance the Hyde Park company had authority to extend and lay its wires from the east to the center of State street. The annexation of the village of Hyde Park to the city of Chicago did not impair the rights of the Hyde Park company.

The Mutual Electric Light & Power company was incorporated March 28, 1893, for the purpose of furnishing electric light and power to the people of Chicago, and by an ordinance of the city of Chicago, passed March 19, 1894, it was given permission and authority to erect and operate a plant for the transmission of electric light, power and heat, in and over the streets, alleys and public ways of that part of the city of Chicago lying south of Thirty-ninth street and west of the center line of State street.

It will thus be seen that the Hyde Park company was authorized to put up wires to the center line of State street from the east, and the Mutual company to put up wires to the same center line of State street from the west. The distance south from Thirty-ninth street to the city limits is about a dozen miles along State street, and throughout that entire length the territories of the two companies adjoin each other.

By the terms of its ordinance or contract with the city, the Mutual company bound itself to erect and have ready for operation, within one year from the passage of the ordinance, a plant to cost not less than $40,000, and to have a capacity of furnishing electric light for not less than 350 arc lights, and if it failed so to do, then to pay to the city $10,000 as liquidated damages.

Being so situated to each other, and the Hyde Park company having its power house and electric generating machinery in operation, and the Mutual company being without a power house or electric generating capacity, and the wires of the two companies coming to State street, those of one company from the east and the other company from the west, the two companies, on June 7, 1894, contracted together in writing as shown by the abstract of record as follows:

"The Hyde Park Electric Light & Power company agrees to furnish and the Mutual Electric Light & Power company agrees to receive electric current of the constant current variety at such points in Chicago lying along the line of State street, adjacent to the territory covered by the present franchise of the Mutual company as may be hereafter mutually agreed upon, at $5 per month for each watt month of energy furnished, provided the watts furnished shall not be less than 60,000 nor more than 100,000 for each calendar month.

"The party of the first part is to furnish, and the second part to receive, not less than 60,000 watt months of energy each month for the period of eight months and as much longer as may be agreed upon by the parties hereto.

"While this contract is in force A. D. Rich shall be the treasurer of said second party and shall receive all money due second party, and shall pay over to the first party promptly on the 15th of each month the amount due it for electric current supplied during the preceding month. In case of failure of second party to pay, the first party is authorized to discontinue the supply of electric current.

"The conditions hereof shall at all times be subject to the laws, rules and regulations, permission and restrictions of the city of Chicago.

"In case of failure on the part of the second party to pay or perform, first party may at its option determine contract."

On June 13, 1894, a permit by the commissioner of public works to string wires on certain poles belonging to the City Railway company, with the consent of that company, on Sixty-first street from State street west to Wentworth avenue, and so on, was given to the Mutual company; and on July 2, 1894, a like permit was given to the Hyde Park company to string wires on poles on the south side of Sixty-first street from State street eastwardly to South Park avenue, and on the east side of State street from Sixty-first street to Sixtieth street, and eastwardly on the south side of Sixtieth street from State street to South Park avenue, and so on.

It will thus be seen that under the two permits the wires of the respective companies were authorized to be strung to the junction of State and Sixty-first streets, one from the West and the other from the East.

The strict letter of the permit to the Hyde Park company confined its right to string wires on State street on the east side thereof, and the permit to the Mutual company was to string wires "from State street to Wentworth avenue."

It is alleged in the cross-bill of the Hyde Park company that said company did, about July 14, 1894, for the purpose of carrying out said contract with the Mutual company, connect its wires from poles along the south side of Sixty-first street and along the east side of State street to the center line thereof with the wires of the Mutual company, and furnish current to the Mutual company as provided by contract, and did maintain and operate electric wires, conductors and system for the purpose of furnishing a current of electricity for light, heat and power to the Mutual company; and that the city, by its agents, without reason or excuse, and without notice to cross-complainant, on said July 14th, caused said wires and conductors along the south side of Sixty-first street and east of the center line of State street to be cut, disconnected and destroyed, and thereby prevented said cross-complainant from furnishing said Mutual company with electricity and from complying with said contract, and that the city has, ever since said wires were cut, refused to allow them to be repaired and again connected.

The injunction granted, as has before been said, was from hindering or interfering with the Hyde Park company in restoring the wires to the condition they were in before they were cut by the city.

The question presented is one of very great importance, involving as it does the power of an electric light and power corporation, which is limited by the very terms of its grant to operation within a definitely prescribed area or territory, to extend its operations generally and indefinitely into other territory not included in its grant, whenever it shall see fit to contract for that object with other corporations having rights within the additional territory.

The Hyde Park company had no authority under the ordinance of the village of Hyde Park, which contains its only grant of power, to furnish either electric light, heat or power outside of the limits of that village, and the boundary of these limits on the west, which is the direction in which it seeks to extend its right to furnish electricity, was and is the center line of State street.

The permit of the commissioner of the Board of Public Works of the city of Chicago (the successor of the village of Hyde Park) to string wires on poles outside of those limits, even if such were the terms of the permit by any sort of construction, could not extend the grant.

The right to furnish and transmit electricity is the essence of the grant. That alone is the public and useful end to be observed. The poles, conduits and strung wires are means to attain the useful end accomplished by transmitted electricity.

The mere permission to string wires might or might not, according to circumstances, be within the control and permission of the executive officers of the village or city, but the right to transmit and supply light, heat and power, by the powerful agency of electricity, over the streets and public grounds of a village or city rests peculiarly and exclusively in a proper legislative grant. And such grant when given will never be extended except by necessary implication from that which is expressed.

Here is a corporation upon which has been bestowed by ordinance a grant to erect and operate a plant for the transmission of electric light, heat and power through streets within the prescribed limits of the village conferring the grant.

No grant is to go beyond the limits was conferred, not even by permission of adjoining municipalities.

Possessing this grant and operating under it, the Hyde Park company, by contract with another corporation possessing a like grant and privilege within another and different territory, connects its wires, at the line where the territories of the two corporations meet, with the wires of the other corporation and proceeds to transmit electricity over the wires of that corporation into territory within which it has no power to operate, with the same effect and for the same purposes that it operates within its own territory.

In every essential the doing of that is the same as if it had strung its own wires within that foreign territory and had transmitted electricity over them for the lighting and heating of, and furnishing power for, that territory.

Such is a most palpable evasion of the limitations of its grant and is a flagrant excess of the due exercise of its powers.

Public policy, as well as the contractual obligations between the company and the city, is most seriously violated by such methods. The limits of franchises granted by municipalities should not be extended by doubtful implication.

If such conduct by the Hyde Park company should be sustained and it be permitted to thus extend itself into the territory it has thus entered it might by successive connections with the wires of other companies with whom it should contract extend itself all over the city of Chicago, or for that matter the whole state.

The cunning of men to overreach their fellow-men, and the state itself, by contrivances which at first sight seem harmless, but are in reality fraught with dangerous tendencies, can best be checked by a strict and, perhaps, severe upholding of the law.

Counsel have intimated that the contract between these two companies is for temporary purposes only, but that is not the way the contract reads. Its provisions are "for the period of eight months, and as much longer as may be agreed upon by the parties hereto."

The provision in the ordinance to the Mutual company that it shall pay to the city $10,000 as liquidated damages in case it "shall fail to complete such plant within" one year, is quite a mere band of straw so far as the erection of a power house and electric generating machinery of its own is concerned.

"Such plant," when read in connection with the "plant"

that section one of the ordinance confers the power to "erect and operate," may perhaps as well mean poles, wires and conduits as a power house or generating machinery, for which, if the contract with the Hyde Park company should be upheld. there would be no use. The same contract provides for the furnishing by the one company and the receiving by the other of electric currents at all points along the line of State street "as may be hereafter mutually agreed upon."

If this connection at Sixty-first street shall be sustained as lawful, then by the same reasoning as many other connections along the entire length of State street south of Thirty-ninth street as the parties should agree upon might be made, and that such was the intention of the parties to the contract is, we think, apparent.

The city officials performed no more than their duty when they cut the connection between the two companies (King vs. Davenport, 98 Ill., 305), and the injunction restraining them from interfering with a new connection of the wires should have been denied. The cause is therefore reversed with directions to the Circuit Court to dissolve the injunction that was granted upon the cross-bill of the appellee, Hyde Park Electric Light & Power company.

Judge Gary concurred in the decision and the opinion, but inasmuch as it was interlocutory he refrained from going into details.

## French Electrical Work.

According to *L'Industrie Electrique* the conditions under which the electrical industry of France is now carried on are not as encouraging as those which obtain in other European countries. Taking 16 stations, a brief description of each is given with special reference to the duration of the concession, the municipal taxation, price of coal and cost of current per hectowatt hour. In the table herewith reproduced from the London *Electrical Review* half of the towns given are English, and it is remarkable that in four of them the cost of fuel should be so high as compared with all the foreign towns excepting Milan. At the same time the Milan undertaking, with coal at 33.67 francs per ton, returns 10 per cent. of a dividend. True its price is high, nearly tenpence per kilowatt hour, but at Dusseldorf, where the price is tenpence and coal only a third the price it is at Milan, there is no dividend at all, nor is there at Breslau, where conditions are about the same. No information appears which explains why this is so, but one must, of course, not judge from the apparently high price that this really seems high to people who have, perhaps, been paying dearly for gas. Again, in Geneva, where water power is utilized, a price of sixpence admits of no dividend.

The Manchester undertaking is too recent for any dividend to have been declared, but it is given as an example of a recent undertaking carried out with the full benefit of all previously acquired experience, and showing the amount of capital necessary for such enterprises at the outset, namely, £129,300 for 28,000 lamps, which may be compared with the Westminster company's £381,000 for 76,700 lamps. Attention is drawn to the fact that with all the perfections of the Manchester station that have been brought about by experience, the cost of producing electric energy is almost the same as at other stations where, coal and labor are also equal.

Of the 16 undertakings in the table, eight only have been able to return a dividend on their last working period, and a general review of these large concerns shows at a glance that the electrical industry is not very prosperous, even outside France. This, too, despite the advantage of large capital and newness of construction, excepting only the Société Suisse, which is the oldest in Europe. All of them, too, except the one at Milan, have longer working hours than is the case in France—that is, the duration of the load period is greater. Foreign enterprises, also, are seen to be more favored in respect of fuel cost, seeing that the price varies from 11 to 24.35 fr. per ton as against 32 fr. in Paris. But there is another cause, viz., the duration of the concession, which is, at least, 42 years, and in many cases perpetual, while in France it is much less; in Paris only 18 years' concession is given. Foreign municipalities, also, do not take a tax on the receipts, whereas this is the rule in France, and amounts, in Paris, to no less than 5 per cent. of the gross receipts, in addition to certain controlling costs and a rental charge of 100 francs per kilometer of line. Even without taking account of the difference in fuel cost for the Parisian companies, the inequality of the duration of the concession has an enormous effect, as it is easy to show, for it is necessary to levy an annual charge on income (when, adds our contemporary, there is one) sufficient to return to shareholders their capital at the end of the concession period. Had the original capital been unchangeable and sufficient to carry through the period of concession it would have been simply necessary to pay off a fixed sum annually, but, instead, the companies have called new capital to satisfy the wants of their new subscribers. The amortisation of capital calls for an annual charge almost in inverse ratio to the duration of the time over which the payments are spread. Thus, at 5 per cent. interest and a period of 18 years, £1 will demand an annual charge of 1.711 shillings, while with a 9 years period the charge becomes 2.814 shillings. Thus it is that French enterprises are placed in a position of inferiority that cannot be gainsaid, and this is the more to be regretted in that if three of the Parisian companies have paid a poor dividend by charging for current a price too high for the bulk of consumers, the other two are working at a loss.

The clauses of the agreement of 1888 were fixed by the municipal council in the belief that electricity had a grand future, and would overturn everything; but they were mistaken, for electricity has superseded but little, simply because of the high price of current, and affairs will remain so till such time as more perfect means of utilization and transmitting current admit of better returns. It is, therefore, necessary that, as a young industry, electricity should be assisted and untaxed, and those who have been instrumental as pioneers might then hope to draw some little revenue from their hitherto unproductive property, which is designated by *L'Industrie Electrique* as a mine of metallic copper under the streets of the great cities of Europe.

If there is anything to be learned from the table, it is that selling price and fuel cost are by no means the chief factors in the equation determining the figures in the final column.

It would appear that French electrical enterprises are now suffering from the extravagant claims once put forward for electric lighting, the result having been that only short concessions, saddled with onerous charges, have been granted to the companies, and practical working has demonstrated the impossibility of profitably working under such heavy loads. In the case of Manchester and Oxford it is believed incorrect figures have been secured, Oxford, with its 5,500 equivalents of light, the cost of installation and mains being given as £116,600, as against a cost in Manchester of £129,300 for 28,000 equivalents.

## American Electric Railway Practice.

At a recent meeting of the Institution of Electrical Engineers at London the subject of electric railway practice in the United States was the chief topic discussed.

N. S. Keith of California was invited to open the discussion. He gave a short description of a plant in California, in which a grade was ascended of 1,600 feet in 3,000 feet by means of electrical power. This was the Pasadena and Mount Wilson railroad, in the southern portion of California. The line ran from Pasadena, and would eventually end on the top of Mount Wilson, some 13 to 15 miles away, at an elevation above the sea of 7,000 feet. The line was completed a year ago last July to the top of Echo Mountain, 3,500 feet above the city of Pasadena, which was some few hundred feet above the sea level. For a distance of four or five miles the grade is a very uniform one of about 7½ per cent. It then went up to a grade which necessitated an ascent, as far as he remembered, of 1,600 feet in 3,000 feet. This ascent was made by a cable run by a 75 horse power Keith electric motor, placed on the summit of the rise. There were two cars fixed upon it at equal distances on the cable, so that when one ran up the other ran down, and they thus balanced. The cars were so constructed that the seats were upon a level, or ran horizontally; the inclination was one of 45°. The motive power was a 75 horse power motor, receiving its current from two sources. At a small town half way between this severe rise and the town of Pasadena were located two 60 horse power gas engines. At various localities in the mountains above were placed dynamos driven by Pelton water-wheels, very small quantities of water having a great pressure playing tangentially against a radial box upon wheels. This was a necessity, because the quantity of water available for water power was insufficient. It was contemplated, and would be carried out by the time the line was completed to the top of Mount Wilson, to derive a quantity of water from the other side of the mountain; 400 feet below the summit of the mountain there was a small stream flowing. It was in contemplation to pump this water for 400 feet by electrical power, allowing it to fall on the western slope of the mountain, where it had a descent of 7,000 feet. Two or three hundred feet in excess of the 400 would ensure the production of sufficient power to run the pump and motor, leaving, then, some 4,200 or 4,300 feet fall for power purposes.

Mark Robinson said a few words on the commercial aspect of the papers. Electric traction, he believed, was going to be a matter of magnitude very few of them were able to gauge, to the great benefit of engineers and electricians as well as to those capitalists who built the lines and the public who would use them and profit at least as much. Not forgetting the good work done in Germany and other Continental countries, and the really remarkable traction works in England, which, unfortunately, were limited in extent, he thought they would all allow that the country which could teach them most in electric traction was America. In the last session they had the general progress of electricity in America sketched for them by the master hand of Mr. Preece; now they had the hand of a younger electrician, who had utilized his stay in that country to report the progress in one particular direction. It should be very gratifying to them that not only did their American friends lay their experience and knowledge open to Mr. Wilkinson as an individual, but also avowedly placed them at his service for the purpose of laying the results before this Institution. Then they had an American engineer coming to them and laying before them fully, and, as far as he (the speaker) could judge, without any reservation at all, not the general facts of car traction, but those important details upon which success depends, the "how to do it" and the "how not to do it," which they wanted to learn. Messrs. Blackwell and Dawson's paper struck him as being very restrained and very free from self-seeking. Their display of apparatus seemed to his colleague and himself so interesting that, having friends in France at present engaged on a large traction scheme, they thought they could do them no better turn than to ask them to come over and be present at that meeting and see that collection of apparatus. Although those gentlemen, owing to the curse of Babel, were not able to join in the discussion, they said they were rewarded for coming over by the inspection of the very interesting apparatus. As one of those who confidently expected very great advantage from the certainly imminent development of electric traction on a great scale, he begged to tender his thanks to the authors.

H. F. Parshall said he had listened to the papers on American tramways with unusual interest, primarily, because he had designed a great amount of the apparatus that was at present used in the United States, and, secondarily, because he was always desirous of finding out whether British engineers had noticed anything peculiar to American tramways, as very frequently they did notice things peculiar to their various other institutions. Perhaps one of the most important points was with respect to the earth returns. As was commonly known, they were experiencing a great deal of difficulty in the United States. He might say, as a result of rather a close study of the troubles there, that they might have been avoided at the start if the engineers had carried out the works upon the principles which were thoroughly well understood, and not difficult to follow, as they knew the connection between the rails was made by bonds and pressure contacts. Now, they had had quite a definite experience with pressure contacts in their central station practice. They knew the folly of having copper surfaces brought into the most intimate relations and at comparatively high pressures—about 300 amperes per square inch was the highest they could work on, even when there was an entire absence of oxidization. Underground they had the contact between copper and iron, and seeing that in a central station they did not go over 50 amperes per square inch, he did not know why they should expect to do so in the case of tramways, where in many cases there was not less than 1,000 amperes per square inch. This was an immediate source of trouble. The matter could be entirely eliminated by simply proportioning the section of the contact between the rail and the bond to suit the current that was to be carried. If they had 1,000 amperes per square inch as the mean value in the bond, then the contact between the rail and the bond should be 20 times the cross-section. For the larger stations such as they were installing in Brooklyn, where the current output was 12,000 or 15,000 amperes on the average, and 600 volts, the amount of contact surface became enormous. This trouble they were overcoming very largely by electric welding. They put in a sort of auxiliary plate and electrically welded it to the rails. With this, so far as had been ascertained, there had been no trouble. In fact, he was inclined to recommend an electrically welded underground system everywhere where it could be afforded. The next point he thought English engineers would be interested to know about was the amount of power taken by an ordinary car under what might be considered average working conditions. He could state as the result of a great many experiments, that the amount of power under approximately the same conditions, varied directly with the number of stops; but under ordinary frequency of stopping, it was one Board of Trade unit per car mile, which was usually regarded as a fair value. A further interesting fact with regard to the amount of power was that the watts per car mile remained approximately constant over a wide range of speed. From this they could draw the interesting conclusion that the watt output of a station was proportional to the number of car miles. With the series parallel method of control the force for starting a car was about 60 pounds at the periphery of the car wheel per ampere. With 50 amperes, or a force exerted at the motor corresponding to 3,000 pounds at the car wheel under ordinary conditions, the car would accelerate at the rate of two feet per second. This was, he thought, quite as fast as was desirable, especially with people on the tops of cars, corresponding to the people standing up in American cars. With the series parallel motor, where the stops were frequent, there was a decided economy in having two motors per car. Where the stops became infrequent, say at every half mile, then the single motor, with rheostat control, compared favorably in efficiency with the two motors in series parallel control. Speaking of speed, he was reminded of the somewhat stringent rules that obtained in England on the matter, and he might say that their practice in the states was roughly that, in the crowded thoroughfares, the car speed was about three or four miles an hour, and in the least crowded thoroughfares, the suburban streets, as high as twenty miles an hour; but the number of people killed, as most always happened, was inversely as the car speed. That was to say, they killed the people on the crowded streets, where the cars were moving slowly. He should like to point out first with regard to this slow speed, that it necessarily increased their investment in cars and motors 50 per cent. for a corresponding number of car miles in the states. As a secondary point the application of electric traction was limited—that was to say, its usefulness was limited—on account of the rule in regard to the outlying districts; it simply lessened the efficiency of the whole thing as an investment to the extent of 25 or 30 per cent. Still, as the statistics they had gathered from the roads in Great Britain showed, there was a satisfactory margin left, and the only point was whether or not engineers should not be able to demonstrate to the satisfaction of the Board of Trade that they might safely drive their cars faster in the less crowded thoroughfares. A point once more brought up in the paper read that night was with respect to the application of alternating currents to street car motors. He was perfectly familiar with the work done on both sides of the Atlantic in the development of alternating currents, and he knew of the work accomplished by Mr. Brown, but he did not see that it left any hope for expecting the adoption of polyphase motors for car traction. The three-phase motor was the only one that approximated to their requirements, and

as that had less torque than the series parallel control it was out of the question: it required approximately equal inductance and resistance in all of the branches. In other words, it wanted a resistance of the earth circuit, which he imagined was rather beyond the engineering of the present day. His next point was with respect to directly connected generators, and their experience with them in the United States. At the World's Fair they made their first grand exhibition from their standpoint with 750 and 1,500 kilowatt directly connected machines. They were to operate the intramural road, in which there were 14 trains, 67 tons per train. The average power taken per train was 42 kilowatts, but the maximum frequently exceeded 300 kilowatts. It was found rather more economical to operate a road of this size with a 750 kilowatt machine. He had at hand the report of the chief engineer in charge of the road, and also the speed and current curves taken, and would be glad to show them to members. An interesting point brought out was that the managing director of the road complained to the engineer in charge of the interruption of service caused by the opening of circuit-breakers. The man, with characteristic Yankee ingenuity, or the lack of it, simply plugged the circuit-breaker, and his statement to the speaker was that when the crowbar was placed across the earth return, it either rolled off or was burned off. The strain on the engine was most severe. The engines were taken down at the end of the exposition, and were found to be in perfectly good condition, so that he judged the mechanical stress brought upon this class of apparatus had no serious influence on the durability of the engine. He might state in conclusion, with reference to the future practice in the United States, and, he hoped, in England, that great fluctuations in power should be avoided. By carefully studying the point, he thought engineers could avoid it. There would be a direct advantage in every respect. The principal one would be the decided gain in economy. The smaller steam engines could be used, and engines worked under average conditions at their most economical horse power. This was what they were striving to do in the states at the present time, but he did not think they were as successful in accomplishing it as were engineers in Great Britain, with their more carefully ordered way of proceeding about engineering matters.

## Electric Traction.[1]

This subject seems to be at the present time the most interesting one in electrical engineering, and many engineers are strenuously working for its adoption and success in this country. We sincerely hope their efforts will result in its extension to a very large degree.

A paper on this subject by C. S. Du Riche Preller, M.A., read before the Institution of Electrical Engineers, gives us an idea as to the extent and usefulness of electrical traction methods in Europe for working steep grade or mountain railways.

First, in regard to cables worked by stationary motors, of which three examples are very briefly described. It will be noted that they are all worked by exceedingly cheap water-power, hence the economical working, but we cannot get water-power everywhere, and even in some cases where it exists, and could be used, the terms upon which it may be utilised are so exorbitant as to become prohibitive; for when the owner of a large waterfall learns that it can be employed to work a railway he naturally begins to calculate upon its value to him, and looks upon it as a valuable property, and no longer as water running to waste.

The author of the paper, without the least attempt at an explanation of his meaning, states that the total efficiency of these cable traction electric railways is 60 per cent. Such a statement requires some explanation as to how it was arrived at. A single motor, a dynamo, or an engine, may be said to have an efficiency of 60 per cent., and we know exactly what is meant. But without the most precise information as to how the efficiency of a complex system is obtained, the simple figure stated is valueless.

We emphatically protest against this loose practice when reading papers before engineering societies, of putting forward figures which are only estimates, instead of actual ascertained results. If only estimates can be given, then we must insist upon having a clear statement of the methods upon which they have been based.

Whatever this 60 per cent. may mean, it cannot possibly mean the total efficiency as usually understood by that term; and as many discussions are about to take place on electric traction, it may be well once for all to define our ideas on total efficiencies, especially in regard to this particular topic.

An electric railway comprises many different machines for transforming and transmitting energy. A prime mover, a dynamo-electric machine, a system of insulated conductors, a moving electro-motor or stationary motor, regulating resistances, and gearing between the motor and the locomotive or car. These are the elements of an electric railway, and there are only two ways to arrive at the total efficiency of such a combination. First, we must measure or estimate the efficiency of each element separately, and add up all the losses to get the total efficiency. Secondly, we must measure the total input of energy at the power house, and total output on the car or locomotive axle, an exceedingly difficult thing to do, and one which, we believe, has never been done in practice.

But we can approximately arrive at the total efficiency by calculating from the well-known efficiencies of the elements of the system, for although it is almost impossible to measure the total input and output, we can easily find many determinations of the efficiencies of the separate elements.

In these cases of water power quoted, we cannot allow a higher efficiency for turbines than 80 per cent.—a very high estimate—then the gearing between the turbines and dynamos must account for at least 5 per cent.; the dynamos, if worked constantly at full load, would waste 10 per cent; but on an electric railway, as the load varies largely, there will be a further loss, about 15 per cent. or more. In the case of the Burgenstock line, after incurring losses in the power house, the remaining energy has to be carried 2.5 miles to the motors. If the author of the paper had given the fall in pressure on the line, we could have found its efficiency; but it is safe to assume that another 5 per cent. would be lost on the way, and probably as much as 15 per cent. may be lost. What is now left of the power is delivered to the motor, which, running at varying speed and load, wastes from 10 to 30 per cent. again. The power is then passed on to the cars through gearing and cables, and these, judging from cable haulage experience, will take at least another 20 per cent. of the power; and what is now left is that actually usefully applied to the work, and we dare say if all these losses are added up, and deducted from the input, that the 60 per cent. efficiency is far too high an estimate of the actual total efficiency.

Throughout the paper total efficiencies are given as 58, 62, 65 and 68 per cent. for different railways, but we cannot accept any of them as correct, for with the plants described in the paper they are impossible figures. The number of transformations of energy, and the amount of gearing it has to pass through, not to speak of the losses in motors running at variable speeds, and regulated by resistances, would account for far more than a loss of 40 per cent.—70 per cent. would be nearer the mark. In a paper of this kind, where details accurately ascertained (such as pressures, currents, resistances, horse powers and curves of performances) are not given, the less said about efficiencies the better; without these the figures can be taken only as the result of guesswork. It is more important to learn from the paper that whatever the total efficiency may be, the lines described are all successful in every respect, for this proves that the advantages of electric traction, even at the present day, are great enough to counterbalance the losses, whatever they may be.

Belt driving is said to be preferable to direct driving for railway work, owing to the great fluctuations in power required. There is probably some truth in the argument, which amounts to saying that the belt introduces some elasticity between the engine and dynamo, which considerably softens the shocks occasioned by the sudden rises and falls in the load. But this is a question which experience alone can decide.

Accumulators or storage batteries are recommended as a remedy against the fluctuations in load, and the installation at Zurich is quoted as an example, but no facts or figures are given in support of the statements. The Isle of Man tramway is quoted as another example of the use of accumulators, but the Isle of Man case is of no value yet as an example. It has not worked long enough, and no results have been published by which its success can be judged. There is nothing new in applying storage; every engineer ever since storage became possible has held storage to be of paramount importance in every installation, whether for light, power or traction. But it is futile to talk of the advantages of storage while the means at our disposal for storage of electrical energy are so limited.

We do not think the alternate current motor is yet perfect enough for traction work, but there is little doubt that if the primary obstacles to electric traction in this country were once overcome so that the business could develop, suitable alternating current motors would be forthcoming.

Multiphase motors might at present be used, but the introduction of a third insulated conductor is both expensive and complicates the system of collection; they have, therefore, not been used except in an experimental way. If storage has any advantage in a traction system, it would be entirely lost in an alternating current plant, and no alternators yet designed could regulate quick enough to keep in step under the violent fluctuation in load. When we come to seriously consider the alternating current for traction, we find that there are disadvantages as well as the advantages mentioned by the author of the paper, and it is well to look at both sides of the question before agreeing with him that the alternate current is destined to supplant the continuous current in traction work. This is one of those questions upon which it is never safe to prophesy unless you know; it is very questionable whether alternating currents will supplant the continuous current even for lighting purposes. The trial is not at an end yet.

1. From the London *Electrical Review*.

## Color Making by Electrolysis.

The principle of electrolysis is finding commercial application in directions which were scarcely dreamed of. An English contemporary names several efficient processes for manufacturing chemicals which are in active operation. One of the latest of these consists in producing Prussian blue and Berlin green. Prussian blue, otherwise known as Paris blue or Berlin blue and Berlin green are well-known and widely used pigments, and with the competition set up, now that it is possible to make them electrolytically, these useful colors should become much cheaper. The process by which they are made, and which is due to H. Goebel, consists in precipating a solution of yellow prussiate of potash by means of a ferrous salt, such as green vitriol, suspending this precipitate in water, and then subjecting it to electrolysis. It is stated that Prussian blue of an extremely vivid violet "reflex" and coppery luster is obtained. Sulphuric, hydrochloric, nitric or phosphoric acids may be added to the electrolyte, so that it may contain 1-20 per cent. of acid. The precipitate is introduced in the immediate neighborhood of the anode, the contents of the anode compartment being kept well stirred, as well as those of the cathode compartment. The hydrogen liberated is taken up by manganese peroxide or by organic nitro-compounds. When the electrolytic action is protracted, the blue color becomes more and more faint and ultimately changes to a dark Berlin green.

The creditors of Elmer D. Roberts, a small electric supply dealer of Racine, Wis., who failed on November 10th, held a recent meeting in Chicago. Mr. Roberts submitted a proposition to pay 50 cents on the dollar, which was finally agreed to. The creditors represented were the New York Insulated Wire company, Metropolitan Electric company, the Central Electric company, the Buckeye Lamp company, the American Reflector Light company, Williams & Schraeder, and Kohler Brothers, all of Chicago, and the First National Bank, the Commercial Bank and the Racine Hotel of Racine, Wis.

## Mirrors of Magnetism.

In a recent paper by Prof. S. P. Thompson and Miles Walker, before the Physical society of London, on "Mirrors of Magnetism," it was pointed out that corresponding to the theory of electric images produced by insulated conductors, there is a theory of magnetic images produced by bodies of infinite magnetic permeability. A magnet pole in the latter theory is the analogue of an electric charge in the former and a body of infinite magnetic permeability is the analogue of an insulated conductor (which is electrostatically indistinguishable from a body of infinite dielectric capacity). Experiments were made to determine how far the magnetic images due to thick sheets of iron accorded with those deduced by theory for the case of infinite permeability. The image of a north pole in an infinite plane sheet should consist of a south pole of the same strength at a point coinciding with the optical image of the north pole, together with an equal north pole distributed uniformly over the surface of the infinite sheet, as a free electrical charge would be, and so exerting no finite action. Working at distances of a few inches in front of the surface, a sheet of iron a few feet in length and breadth and a couple of inches thick was found to realize the theoretical conditions with very tolerable exactness. In a coil of wire placed on one side of the sheet, a current was started or stopped, and the electromotive impulse produced in a subsidiary exploring coil was detected by means of a ballistic galvanometer. That the effect of the actual mirror was equivalent to that of the theoretical image was verified by substituting for the iron a coil equal and similar to the first and coinciding with its optical image. Sending the same primary current as before round the two coils (with due regard to its direction in the second coil), hardly any appreciable difference in the secondary impulse was observed. This was found to hold good whether the original primary coil had its axis perpendicular or oblique to the plane of the magnetic mirror. Some observations on spherical sheets were also recorded, but in this case the conclusions were less simple.

## Car for Snow Fighting.

A local paper describes a snow-fighting car devised by Superintendent Scheidler of the Newark, O., electric railway lines. The superintendent metamorphosed an old horse car in the following manner:

Taking out the seats on the sides, he built two boxes, one on each side, the full length of the car. The boxes are intended to be filled with salt, and in the center of each box is a hole running through the bottom of the car to let the salt through on the track. An iron pipe reaches from the bottom of the car to within six inches of the track and a rubber hose is attached to this and reaches within one inch of the track. A stick is used to punch the salt through the hole as is needed. Along the car, running clear around it and coming to a sharp point at both ends, is an inch board about a foot wide reaching to within four inches of the track, and to this is an extension that will be used principally on the Granville line that comes within two inches of the track. Right back of this board is an iron scraper that reaches to the rail, and back of this is a broom that also reaches to and sweeps the rail, thus making altogether almost a complete machine to clear away the snow. The arrangement made to put the salt on the track is about the best part of the outfit. The car is intended to be put ahead of the motor and thus a clear track is easily made.

## Responsibility of a Motorman.

"I have been all through the war," said a grim-visaged old motorman on a Girard avenue trolley car to a reporter for the *Philadelphia Record*, "but sure as I live my feelings on going into a battle were pleasure as compared to the dread of killing somebody which fills me the moment I grab the brakehandle of this car every morning. I can't explain why, for I haven't had an accident of any kind since I took the job, but it may be due to the fact that we are so strongly warned to be careful, and, in case we do run down some unfortunate, to get the names of as many witnesses as we can. I would sooner hold the reins of my old pair of nags at less money than be a trolley motorman," concluded the serious-faced veteran as he suddenly applied the brake to allow a party of school children to cross the street in safety.

## Electric Railway Block System.

The Chester, Pa., Traction company has placed in operation a block system for the purpose of showing how far ahead of the car the track is clear, and thus prevent collisions. For the present a block post will be planted at Seventh and Potter streets. The system consists of three separate banners, of different colors, operated by electric motors from a rail contact. At night different colored lights will be used. Rear-end collisions are impossible when the signals are obeyed, and in the case of the Chester Traction company the signals will be especially valuable at the junctions of the branch lines.

An organization known as the Natchez Electric Street Railway company has just been formed in Natchez, Miss., with a capital stock of $100,000, with the privilege of increasing it to $250,000, if necessary. The object of the company is to build, operate and maintain lines of electric railway through the streets of the city and suburbs. Some very wealthy men are named as being connected with the enterprise, and it is thought that they mean business.

## American Institute of Electrical Engineers.

On December 19th Ludwig Gutmann read his paper "On the Production of Rotary Magnetic Fields by a Single Alternating Current" before the Chicago branch of the Institute. This important paper is given in full in this issue of the WESTERN ELECTRICIAN. In New York the paper was read in abstract and the discussion opened by Dr. M. I. Pupin and continued by Messrs. Wolcott, Kennelly and Burnett.

At the meeting of the council in the afternoon the following named associate members were elected: F. S. Blackall, New York city; G. DeRyckere, Grand University, Belgium; Harry E. Dey, Brooklyn, N. Y.; George Wallace Graham, Brooklyn, N. Y.; Vance Lane, Omaha, Neb.; Henry Ackley Lardner, State College, Pa.; Percival Robert Moses, New York; Charles A. Pratt, Chicago; Louis Privat, Chicago; John C. Shedd, Marietta, O.; G. Hamilton Vanderslice, Pittsburg, Pa.

The following named associate members were transferred to full membership: Henry G. Reist, Schenectady, N. Y.; E. W. Trafford, Richmond, Va.; Henry Jackson, Horwich, Bolton-le-Moors, Lancashire; William Frederick Blakeway Ronquette, New York; Fritz Uhlenhaut, Jr., Philadelphia, Pa.

## Suggestions for an Index of Engineering Literature.

In the discussion on Prof. Shepardson's paper before the American Institute of Electrical Engineers on this subject, Ralph W. Pope related his experience in this line and gave some interesting reminiscences. Not the least important was an account of a former effort by the organization to compile an index such as is now suggested. Mr. Pope said:

As the index formerly published by the Institute has been referred to, it may be of interest, at least to some of the more recently elected members, to know why the work was undertaken and why it was suspended. The matter was brought up in council about seven years ago by Mr. Mailloux, and the proposition at that time was that it should be done by the secretary. I had never done any indexing of the kind and that was one reason why I did not undertake it. I have been very glad since that I did not assume the responsibility. However, we had a member, who kindly undertook the duty and it was carried on for some time, until I think it became too much of a burden for him, and it was dropped. I do not know whether at that time I had heard of the experience of two Philadelphia editors. Pehaps Prof. Houston may know something of it. They were equal partners in a daily paper, and one of them had secured the advance sheets of a serial novel which he proposed to publish in daily installments. The editors did not agree upon the question as to whether their readers wanted this kind of mental pabulum, and after it had gone on a week or so, they had a little tiff as to the expense, and whether the people wanted it, and finally they compromised, the editor who objected to it saying, "Let us drop it out, and if we have a complaint from any of the subscribers that we have not finished the story, why I will submit to your idea and we will go on and publish the story to its conclusion." So they actually dropped it, and they waited a week or two and not hearing a word from anybody, they concluded there was no general interest in the subject. I felt that way about our index. At that time, of course, we had only three or four hundred members and perhaps the need of an index was not appreciated at that time as much as it is to-day. I might add incidentally, also, that the proposition was made that the index be printed on one side of the leaf only, so that members who desired could cut it up for their card catalogues. Of course that would add considerably to the expense when we came to print 500 copies, and I cogitated over it a little, and suggested another plan that if any member wished to cut it up for a card catalogue we would supply him with an extra copy for that purpose. I thought that would be cheaper than to run a whole edition printed on one side. We had three applications for an extra copy to cut up, and those were furnished to the members who asked for them. I mention this because the printing on one side is suggested by Prof. Shepardson, but it is proposed to apply a little salve in the shape of advertisements, on the other side that would perhaps pay the extra cost. But what I was going to say was that taking this into consideration, and also the experience of the Philadelphia editors, I thought I would wait and see if anybody complained because we did not continue the index. I believe no inquiries were made. Possibly the members thought it was all right, and that we had good reasons for dropping it. Later this subject has been brought up, and my advice has been asked by one of the editors who was referred to to-night, who inquired what I thought of such a publication as a commercial venture. I told him that my experience was that there were a few people who wanted an index of this kind, and wanted it very badly. But I didn't think they wanted it sufficiently to pay the expense of getting it up. That is to say, there was a limited demand and perhaps that limited number who wanted it would be willing to pay a pretty fair price, but at the same time they would be willing to pay but a small proportion of what it actually cost to compile and print, and that is one reason why it has not been a successful financial undertaking. There were some other points about it that I brought up at the same time. One was this, that there are a great many engineers, not only in the branch of electrical engineering, but other branches as well, who compile their own indexes and have their own ideas about what they wish a catalogue to be, and therefore an index compiled by others, unless it was thoroughly complete, might not satisfy their wants. That is to say, each man feels that if he runs the index himself, he would know exactly what he wanted, and he could discard what he did not want, and a man who was very thorough and very particular would not have that confidence in the work of others which would lead him to throw up his own and take that of somebody else, especially if he doubted its permanence.

There is another point about an index of this kind which is worthy of consideration, and that is that, like some other things, it improves by age. An index that is only a few days old does not amount to anything; but after it has been kept up for five or ten years it begins to become of greater value, and, if the man who undertakes it is patient enough he may arrive at that time in the course of his life when he will meet with his reward. But the difficulty is that few of us are willing to keep on till that time. We get tired, as some of our friends have confessed to night, with shuffling these cards and going over these papers. Perhaps my early experience in making literary scrapbooks was one of the reasons why I refrained from taking up indexing. Those scrapbooks are something over twenty years old now, and occasionally when I do not feel first rate I get out one of those scrapbooks, and am thankful that I was so industrious in my younger days.

Then, again, an index for the public, as it were, should, of course, be general and cover all branches. It would be necessary, I suppose, to classify it in some way; but, in order to meet the general market, it would have to cover all branches of electrical engineering, at least. I ran across, in the English paper called *Industry*, a few years ago, a reference to the first use of electric welding by Siemens in the Siemens factory in welding the iron wires of an armored cable, and this reference spoke of its coming up in a discussion before the Iron and Steel Institute in 1887. The date was given, and all the particulars about this use of the process; and I thought it was a very interesting fact. So I went on a search for that and found the discussion at the very meeting of the Iron and Steel Institute, but could not find a word about electric welding. Now, a good index, I presume, would have brought that to my attention; but I could not find it.

Associations of this kind exist for doing a certain class of work that is of interest and value to the members, but which will not be undertaken by any person or firm as a commercial venture. This question has come up many times in regard to certain papers that have been published in the transactions, papers that are of value as works of reference and which many of our industrious editors abstract or squeeze out altogether, but which some one should publish; and it appears to me that that is one of the missions of a technical society—to do work in a co-operative way which is of benefit, perhaps, not to all the members, but to a few of the members; and the few that are not benefited this time may be benefited next month or next year. So that the mere fact that work of this kind is not financially profitable should not debar the Institute from undertaking it if it is considered of value to the membership.

The question of co-operation with other societies was brought up by Prof. Shepardson, which is worthy of some attention. My experience has been that it would not be worth while to undertake to co-operate in this way. I believe that we should go on with our own work and keep as close to the line of electrical engineering as possible. Of course we must wander over into the line of mechanical engineering and steam engineering to a certain extent. But, in undertaking it, I think that it might be well to propose a system which would meet with the approbation of the other societies, so that, in case they should undertake something of the same kind, the work might be conducted on the same system, so that any person who is interested in all branches of engineering could combine the three as systematically as possible.

A committee was appointed by the council to consider the question of an index of electrical literature. The committee is composed of Prof. F. B. Crocker, chairman; Edward Caldwell, A. E. Kennelly, Prof. W. M. Stine and Prof. George D. Shepardson.

# CORRESPONDENCE.

## New York Notes.

NEW YORK, December 20.—On Tuesday the extensive isolated electric lighting plant in the store of Hilton, Hughes & Co. was completed. This is one of the largest private plants in the country, having a capacity of 12,000 incandescent lamps. There are six large boilers, and great care has been exercised to provide a model installation in every respect, the work on the plant extending over a period of ten months. The engines were started at 4 P. M. on the 18th by ex-Judge Henry Hilton. The dynamos are placed on the Tenth street side of the immense building and are encased in glass from the customers' side of the house, thus permitting a free, unobstructed view of their operation.

The woes of electric railway companies are many, and occasionally their troubles take an amusing turn. This was the case when the Consolidated Traction company of Jersey City attempted to replace its horse car line on Johnson avenue and Pine street, Lafayette, with overhead electric construction. This account, given by the *Sun*, is worth repeating:

Expecting a protest of some kind, the company had its men working all Sunday night digging the holes for the trolley poles, and early Monday morning they started to set them up. One pole on the corner of Johnson and Pacific avenues had been successfully planted, and the men started to put up its companion on the other side of the street, when Henry Vrooman, acting on behalf of the Claprosses, who own a large part of the real estate in that district, planted a chair over the hole, sat down in it, and refused to budge.

The bystanders backed him up, and the men started to put in a pole a few feet away, leaving Vrooman sitting in his chair.

They had hardly started on this one before Miss Minnie Claproos, a determined lady of possibly thirty years, came up and ordered them to desist. The men laughed and went on with their work. After watching them a minute Miss Claproos turned around and jumped into the hole, exclaiming:

"Now, let's see you put that pole up here!"

The men stood back amazed, and the crowd of bystanders which had by this time gathered cheered enthusiastically. The hole was about four feet deep, and Miss Claproos is small and slender. Only her head, with its snapping black eyes, and the upper part of her shoulders could be seen above the pavement. As soon as the noise had subsided she turned her head around, and beckoning to a young lad, told him calmly to go and tell her brother that he must send some one to fill in the hole.

"And, mind now," she concluded, "don't you tell him what I've done."

This happened about one o'clock in the morning, and until nearly three o'clock in the afternoon the little woman's head was seen above the pavement, her eyes glaring defiantly at the company's workmen and her head nodding approval as she saw the other property owners and residents successfully putting a stop to the work.

When the man sent by Miss Claproos' brother arrived, the little lady was pulled out in triumph. Other residents were equally emphatic in their protests, and the company was finally obliged to make some concessions.

The State Board of Railroad Commissioners has dismissed the charges of H. M. Thompson against the Brooklyn City Railroad company, alleging that the financial reports had been doctored so as to deceive the stockholders. The board finds that the company's connection with the Long Island Traction company is in the interest of the stockholders, and that its accounts are all correct. Thompson is a stockholder in the Brooklyn company and is dissatisfied with the management of the corporation.

At a recent meeting of the Board of Electrical Control, when the application of the Special Fire Alarm Signal company for a franchise came up for consideration, the president of the company, Mr. Pierce, made the curious acknowledgment that the company had been doing business for twelve years without a franchise. The company recently discovered that even at this late day it would be a good thing to have one. No final action was taken on the application.

W. F. O.

## Milwaukee, Wis.

MILWAUKEE, December 21.—The efforts of Mr. Tillotson's Wisconsin Interurban Railway company to get the rest of the franchises needed in the Fox River valley towns continues to be the chief topic of interest among the electricians of the state. At Neenah the company has suffered defeat, and at Menasha action upon its application for a franchise has been deferred again. At a meeting held at Menasha the other evening a committee of citizens made a report to the common council in which it was stated that a franchise like that solicited by the Interurban company was already vested in the Menasha & Neenah Street Railway company and recommended that no other franchise be granted until the existing franchise was out of the way or until the Common Council was satisfied that no legal trouble would result from granting like rights to the Interurban company. The committee also reported that no company under the name of the Wisconsin Interurban Railway company had any legal existence. It also reported that it had found that Mr. Schumacher, the owner of the existing lines, had given an option on them at a very low figure to responsible men, the option to run until January 1st, and that if the option did not result in the sale of the road, Mr. Schumacher would sell the lines to any responsible bidder. The men who hold the option, according to the report of the committee, are Messrs. Elmore and others of Green Bay. Mr. Tillotson of the interurban project held the option at one time, the committee reported, and had forfeited it. The committee wound up its report by declaring that it was unanimously and unreservedly in favor of the interurban line, but recommended that the Common Council be not hasty in granting the franchise. A letter from A. L. Smith of Appleton was also read at the meeting. Mr. Smith started out by saying that it seemed to him that the granting of any franchise by Menasha to an outsider would be extremely hazardous at present. The sentiment of the people of the Fox River valley, he said, was largely in favor of the building of an interurban line from Neenah and Menasha to Kaukauna, but none of them wanted the line built by speculators, or the franchises put in the hands of speculators. The franchises should be controlled and owned by those who went into the enterprise as an investment. From representations that had been made it seemed that there were millions of money ready to take hold of the enterprise. Mr. Smith suggested that the council place the franchise in the hands of three trustees, to investigate the different propositions and report to the common council for its approval. After the attorney for Mr. Schumacher had stated that that gentleman had invested $18,000 cash in the present railway system and did not intend to see his rights taken away without a fight on his part, although he did not intend to block any legitimate enterprise so long as

he did not suffer, Editor T. B. Reid of Appleton got the floor and proceeded to explain Mr. Smith's letter. He said that Mr. Smith had arranged with eastern capitalists to absorb his Appleton street railway and to build the interurban line, and that the company stood ready to begin the work. Mr. Reid further said that the people and the Common Council were friendly to Mr. Smith and that no other company could get a franchise through that city. The speaker added that the company would put up bonds for $20,000 or for any other reasonable amount. President Pierson of the Appleton council endorsed what Mr. Reid had said. One gentleman stated that Mr. Tillotson was the first promoter of the road and that he ought to have the franchise if he could get financial backing; otherwise he would be shamefully treated. Mr. Reid explained that while Mr. Tillotson did not have any connection with Mr. Smith's enterprise, still he would be paid for his work, and that the Smith company would buy out Mr. Schumacher if it could get the opportunity. A vote was taken as to what the people of Menasha preferred, a road to Kaukauna or one to Oshkosh, in case both were out of the question, and the Kaukauna line got a big majority. The council adjourned until a week from next Tuesday without taking any definite action.

At the meeting of the Neenah Common Council the Tillotson franchise was killed without any ceremony. The members of the council who had investigated the matter were of the opinion that Tillotson and those whom he represented were not sincere in their dealings with Neenah and the ordinance was shelved. A proposition was presented by W. L. Davis and Thomas Higgins asking that a franchise similar to the one that Tillotson had sought be granted to them. If the franchise were granted to them, the applicants stated, the road would surely be completed and in operation by September 1, 1895, as they meant business. Their idea was to build a line from Oak Hill cemetery to Brighton Beach, independent of the street railway now in operation. It is thought that if the Neenah council grants any franchise Messrs. Davis and Higgins will get it. The matter is in the hands of a committee of three at present.

Tillotson has not given up the fight, however, and Oshkosh, the largest city along the route of the proposed interurban line, is still supporting him. He declares that the Wisconsin Interurban Street Railway company will be incorporated, and that it will build the line in Oshkosh without fail, and also the line from Oshkosh to Kaukauna if the franchises can be obtained. He announces that the following named gentlemen will serve as directors of his organization: George H. Ketcham of Toledo, O.; J. Kobusch, secretary, treasurer and general manager of the St. Louis Car company; Otto Van Schrader, secretary, treasurer and general manager of the Rankin & Fritsch Foundry & Machine company of St. Louis; Charles E. Loss of C. E. Loss & Co., contractors, Chicago; Worman McCarty of the Westinghouse Electric company of Toledo; F. M. Ohl, Toledo, and W. C. Gottshall, St. Louis.

Superintendent U. J. Fry of the telegraph department of the Chicago, Milwaukeee & St. Paul Railroad company and G. M. Basford, formerly engineer of signals on that road but now engaged in electrical appliance work in Chicago, have just patented a new railroad block signal system. It is claimed that the system makes collisions from the front or the rear impossible unless the enginemen flatly disobey the rules regarding signals. To let a train out of a block requires the work of two operators, from three to five miles apart, and in order to permit any accident both of them would have to make the same blunder at precisely the same time. The invention consists of a set of instruments connected with the rails and also with the semaphore at each block signal station. When the track is clear as far as the next station, the train is allowed to pass into that block, and the semaphore at the station which the train leaves is locked so that the operator at that station cannot open it if he desires to. When the train arrives at the other end of the block the operator at that station unlocks the semaphore at the first station by pressing a button on his desk, which notifies the operator at the first station that the train has passed out of the block. By a train's entering the block the signal system is placed in an abnormal condition, and when the train leaves the block, it automatically places the system in its normal condition by contact with the electrical device on the track. A train following would be locked out of the block by the operation of the track system as well as by the operators. The system, it is claimed, applies equally as well to single track roads, preventing a train going east from entering the block so long as there is in the block a train going either east or west.

There is pending in the common council of Oconomowoc a franchise for a street railway system to be operated by horse, electricity or other power.

The Milwaukee Board of Public Works has decided to operate the folding draw of the new Sixteenth street viaduct by electricity. The current will be supplied from the National avenue street car line. The city will have to pay for the power, because the bridge is not one over which cars are run.

The contract for the complete construction and equipment of the Waukesha Beach railway has been awarded to C. E. Loss & Co. The rolling stock has not yet been ordered.

Before the engineering students at the Wisconsin State University at Madison, Louis A. Ferguson, electrical engineer of the Chicago Edison company, recently delivered the first of a series of lectures by outsiders on electrical subjects. His subject was "Modern Electrical Power Stations." C.

## PERSONAL.

H. T. Richards, of the *Electrical Review* of New York, has resigned to accept a responsible position with the Fidelity & Casualty company of New York. Mr. Richards is an experienced advertising man and in his five years' connection with the *Review* he made a large number of friends, who will join the WESTERN ELECTRICIAN in sincerely wishing him success in his new venture.

## NEW INCORPORATIONS.

Findlay Telephone company, Findlay, O.; capital stock, $15,000.

Ferris Electric & Manufacturing company, Cedar Rapids, Iowa; capital stock, $10,000.

People's Electric Railway company, Terre Haute, Ind.; capital stock, $100,000; to operate an electric railway; A. J. Crawford, Terre Haute, Ind.

American Telephone Construction company, Anderson, Ind ; capital stock, $200,000; to construct and operate telephone plants at Noblesville, Lebanon, Bluffton, Laporte and Anderson; Charles M. Harriman, Anderson, Ind.

Sidney Electric Railway company, Sidney, O.; capital stock, $100,000; to operate a line of electric railway in and through the village of Sidney, thence to the village of Loramies, thence to the village of Minster, O., for the carrying of passengers, baggage, mail, freight and express.

## ELECTRIC LIGHTING.

The electric plant in Osawatomie, Kas., was burned on December 11th, entailing a loss of $8,000.

The Edison plant in Oskaloosa, Ia., was destroyed by fire on December 12th. The loss is estimated at from $10,000 to $12,000, partially covered by insurance.

The Dayton, O., Electric Light company is said to have passed out of the control of the General Electric company. The stock is now owned almost entirely in Dayton.

Electric light was introduced in Grand Island, Neb., on December 1st, the company starting with 500 lamps. It is claimed that this number has been increased to 1,000 lights. There is a lively competition between the electric and gas companies.

The application of the city solicitor of Middletown, O., to enjoin the city council from entering into a contract with the Middletown Electric Light & Power company for the lighting of the streets of Middletown for the next ten years was denied by Judge Giffen at Hamilton. The city solicitor sought to set aside the contract on the ground that it had not been let to the lowest bidder; that the election was illegal for the reason that it should have been held at the spring election, as the statutes provided for the holding of such elections at the regular election of the municipality. The court overruled every point made by the solicitor, deciding that the word "regular" in the statutes did not mean the spring election, but any election where the people were called upon to vote on questions of general public interest. The solicitor has given notice of appeal.

An ordinance has been introduced in the Chicago city council granting a franchise to the Citizens' Light & Power company to lay electric wires for a term of twenty-five years in or under the streets, alleys and sidewalks by and with the consent of the adjacent property owners in the down-town business district bounded as follows: On the north by Jackson street, on the east by Lake Michigan, on the south by Taylor street and on the west the south branch of the Chicago river. The franchise grants power to lay, operate and maintain within the territory named a line or lines of electrical conductors for the purpose of furnishing light, heat and power. The ordinance provides that the work shall be done under the direction of the commissioners of public works; that no work shall be done except between the hours of 7 P. M. and 7 A. M., the work to begin at once, and all streets, alleys or sidewalks torn up shall be restored, the company giving sufficient bond for this purpose before the permit is issued. The ordinance also provides that the company shall deposit a bond of $25,000 with the comptroller and shall also pay to the city yearly 3 per cent. of the gross receipts of the company.

## ELECTRIC RAILWAYS.

C. E. Loss & Co. will build the electric railway from Alexandria to Marion, Ind., for $525,000. This firm also built the road from Broad Ripple to Indianapolis, and has the contract for the Indianapolis and Franklin road.

The six miles of the Castle Shannon narrow-gauge railroad, near Pittsburg, will be changed to standard gauge and electricity substituted for steam as motive power. If the plan is successful the number of stations on the line will be doubled.

The Traction company of Baltimore expects to have its Gilmor street line equipped with electricity by January 15th. The line is now operated by cable. Contracts for the overhead work have been awarded and the electric cars have been built and are on their way to Baltimore.

The Laurie Engine company, Montreal, has built for the Toronto Street Railway company the largest engine ever manufactured in Canada for a similar purpose. Its normal capacity is 1,200 horse power, and its generative power from 1,500 to 2,200 amperes. It cost over $50,000. The fly-wheel weighs 80,000 pounds, is twenty feet in diameter, and is built directly on the shaft and put up in ten sections. The combined weight of the fly-wheel, armature, shaft and generator is upward of 70 tons.

Work will shortly be begun on the Baltimore-Washington Boulevard company's electric line. It is understood that contracts have been let for the line between Washington and Laurel, a distance of 17 miles. It is expected that cars on the line will reach a rate of speed of a mile a minute, but the scheduled time will be about one hour between the two cities. David Newbold, president of the company, is in Philadelphia completing arrangements for the work. The road will reach Baltimore by way of Catonsville.

By paying into the treasury of the town of Cicero, Cook county, Ill., $25,000 within thirty days and giving a bond for the same sum to insure completion of the road within two years, the Ogden Street Railroad company has obtained the right to operate electric railways in the southern part of the town. The overhead trolley system will be used. The fares will be five cents for a continuous trip and transfers will be given to the Cicero & Proviso street railroad. The company will invest $1,000,000 in tracks and rolling stock.

The Detroit Railway company, which proposes to make a 3½ cent fare rate, has been incorporated with a capital stock of $1,000,000. One-half of the stock is taken by the Packs and Everett, and $100,000 of this stock has been paid in. The remainder will be paid in when called for. It cost the company $500 in a state tax to incorporate. When and to whom the remaining half of the stock will be issued is not decided. The directors of the new company were elected as follows: Green Pack, Albert Pack, H. A. Everett, C. L. Pack and C. W. Wason.

The building of the electric road on West Monroe street, Chicago, is progressing at an astonishingly rapid rate. There is something mysterious about the work. The company is prevented by its franchise from using the overhead wires; it is not being built for an underground conduit system; its owners will not tell just what system is to be used. Possibly some form of storage battery is to be used to provide motive power, but it is more likely that the overhead system will be eventually employed. This new road is being built by the Chicago & Jefferson Urban Transit company. It may be controlled by Mr. Yerkes, or it may not. That is another bit of mystery. Anyhow, the road is being built and built rapidly—from Canal street out Monroe to Morgan, then north on Morgan to Fulton. That is to be the present western terminus.

## MISCELLANEOUS.

Negotiations are in progress by the management of the Cotton States and International Exposition at Atlanta for an electric fountain of very much the same character as that which was in operation at the World's Fair. This feature in the center of the open area will be one of the most attractive, and will draw thousands of people at night.

The South Yuba Water company has applied for a franchise to bring in electric energy for power, light and heat into Sacramento, Cal. The power site is at Newcastle, thirty miles distant, and the company proposes to supply Auburn, Newcastle, Penryn and Rocklin with electricity. The company claims to be able to furnish 4,500 horse power for Sacramento.

An idea of the part electricity plays in the development of cities may be gained by comparison of the statistics which have just been gathered by Prof. Gilmore for the article upon Rochester in Johnson's Encyclopædia with the article written ten years ago by Fred. A. Whittlesey. The population in 1880 was 89,360; in 1890, 133,896, and in 1894 152,000. In the last ten years the increase has been over 50,000. Three gas companies with a total capital of $1,800,000 and with 90 miles of mains supplied the city with unsatisfactory gas light ten years ago. The gas and electric company with a capital of $4,300,000 furnishes the far better gas and electric light that is now Rochester's. A street railway company operated 40 miles of track in 1880 and offered for the accommodation of passengers the bobtailed horse cars that moved little faster than one would walk and in the bottom of which was loose straw in winter to keep the feet from freezing. How different the facilities offered to-day! There are 85 miles of trackage, over which the rapid and comfortable electric cars carry its passengers in less than one-half of the time. The transfer system is also an innovation.

## TRADE NEWS.

S. Victor D'Unger, formerly of the electrical firm of D'Unger Bros. of Baltimore, is now connected with Taylor, Dee & Mack of 320 Dearborn street.

The Fontaine Crossing & Electrical company, Detroit, Mich., has appointed F. P. Thorp its Chicago agent, with offices in the Rookery. Mr. Thorp recently established himself as designer of electrical and mechanical apparatus for complete electric light and power plants. He is well known to the electrical fraternity, having been connected with the Brush Electric company, the Detroit Electrical Works, the World's Columbian Exposition, and the Siemens & Halske company.

The foreign business of the R. D. Nuttall company of Allegheny City, Pa., is growing considerably of late. The company has shipped an order of "improved trolleys" to Paris, France, to be used on an electric street railroad, and

it is now about to fill a similar order for a street railway company in Belgium.

The Lancaster Railway Construction company has secured the contracts for building the extensions of the Reading Traction company's system at Reading, Pa. The first line will be fifteen miles in length and work will be commenced at once. Everything will be up to the highest standard and the Medbery line material will be used on the overhead line work. All material will be furnished by the Hubley Manufacturing company.

## BUSINESS.

A very interesting catalogue of some up-to date electrical specialties is being mailed by the Washington Electric company, Chicago. Anyone wishing to secure a copy can do so by sending a postal card to the company.

The Berlin Iron Bridge company of East Berlin, Conn., has just completed a new boiler house for the Metropolitan Electric company at Reading, Penn. The roof of the Clinton, Mass., Wire Cloth company's new boiler house is of iron, and is covered with the Berlin company's anti-condensation corrugated iron.

For ten years the desk calendar issued by the Pope Manufacturing company, Hartford, Conn., has held a unique place among business helpers. The calendar for 1895, which is just issued, is even brighter than its predecessors in appearance, as clever artists have added dainty silhouette and sketch to the usual contributions that have heretofore given this popular calendar its charm.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued December 18, 1894.*

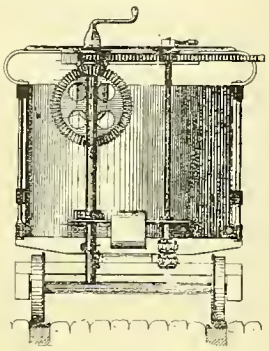
530,951. Electric Conduit. Thomas T. La Pointe, James H. Flanagan and Charles A. Thompson, New Haven, Conn. Application filed November 23, 1893.

A conduit for electric light wires, consisting of separate sections, each of which has a peripheral casing, heads thereon provided with joint rings and a grout composition in the casing perforated with passages extending from the fillings in one head-plate to the fillings in the other head-plate, is described.

530,954. Trolley Wire Finder. Frederick F. Meyer and William S. Meyer, Newark, N. J. Application filed March 14, 1894.

In this trolley device there is the combination of the trolley pole and wheel, with a trolley wire finder pivotally connected with the trolley pole, consisting essentially of pivoted finder arms extending laterally back of the trolley wheel, a ring having a loop connected with the finder arms, and means connected with the ring and its loop for bringing the finder arms in position on opposite sides of the trolley wire.

530,956. Hand Operating Mechanism for Electric Locomotives. Andrew W. Mitchell, Boston, Mass. Application filed April 14, 1892.



NO. 530,956.

The second claim for the invention herewith illustrated follows: In an electric car, in combination, a rod connected to the brake mechanism for braking the car, a gear secured thereto, a miter gear secured thereto, a miter gear turning in a suitable support and engaging with the brake rod miter gear, a lug or ear piece on the separate miter gear, a rack bar arranged to slide back and forth in a suitable support and engage with the gear on said rod, a lug or ear piece on said rack bar arranged to engage with the lug or ear piece of the miter gear, a rod turning in suitable bearings arranged and adapted to be connected to the rheostat or electric controller of the electric motor and a gear secured to said latter rod engaging with the rack bar.

530,957. Finger Board Telegraph Key. Elmer E. Mullnix, Burlington, Kas. Application filed July 31, 1894.

A series of independently revolnble telegraphing wheels provided with peripheral symbol projections, and a single continuous movable press rod normally held in contact with the peripheries of all of the wheels and arranged to work over and onto a separate telegraph or circuit closing key.

530,975. Circuit Closer for Burglar Alarm Systems. Alfred Stromberg, Chicago, Ill. Application filed May 24, 1894.

A plate connected in a protective circuit, a plunger adapted to make contact with the plate and to be depressed when the covering is closed, contact springs adapted to be engaged by the plunger in the depressed position thereof, a resistance connected between the springs and ground, a local circuit at the central office containing a battery and a signal device, an electro-magnet thereat adapted to close the local circuit when the protective circuit is opened, and an electro-magnet adapted to close the local circuit when the resistance is cut from the circuit.

530,976. Burglar Alarm System. Alfred Stromberg, Chicago, Ill. Application filed May 24, 1894.

The first claim is given: The combination with a removable covering for an opening, of a socket provided with contacts, a removable plug provided with contacts adapted when the plug is inserted in the socket to engage the contacts of said socket to complete a protective circuit, said socket being so located that the plug, when inserted therein, will lie in the path of said removable covering to prevent the uncovering of the opening without the removal of the plug, and signal apparatus in circuit with said plug adapted to sound an alarm when the plug is withdrawn from the socket.

531,002. Electric Program Clock. John L. McCaskey, Waynesborough, Pa., assignor to Frederick Frick. Application filed September 13, 1893.

The principal features of this invention are: A calendar switch, the ratchet of which is provided with a single movable contact and a series of conducting plates in the path of the contact and insulated from each other, and having suitable electrical connections and means controlled by the clock for rotating the spindle of the calendar switch.

531,005. Electric Converter. Frank C. Priestly, San Francisco, Cal. Application filed February 16, 1894.

In the electric converter described there is a core composed of two segments formed by superposed sheets of thin metal fastened together, the sheets of each segment having a series of extensions or projections extending between corresponding extensions or projections on the opposing segment, and the ends of the projections on each sheet are beveled or inclined in the same direction, with means for forcing the segments together.

531,018. Sign Advertising Machine. Orlando P. Briggs and William R. Patterson, Chicago, Ill. Application filed January 26, 1894.

This invention is a form of the device now quite generally employed for forming words or characters with electric lamps successively illuminated, and an automatically operated pointer which traces the words or characters as the lamps are lighted and extinguished.

531,070. Controlling Device for Elevators. Alonzo B. See and Walter L. Tyler, Brooklyn, N. Y. Application filed August 24, 1894.

An electric elevator is provided with a stationary shunt-wound motor, a magnetically controlled reversing switch and circuit closer at or near the motor, a resistance in the armature circuit, a regulator for gradually cutting it out, a regulator for gradually varying the resistance of the field magnet circuit, and a controller mounted on the car provided with contacts for controlling the reversing switch, the circuit closer and the field magnet resistance.

531,077. Coupler for Organs. Charles Wales, Detroit, Mich. Application filed February 10, 1894.

In this instrument there are a series of pipe actuating devices and an electric circuit arranged in multiple, contacts in the circuit, a switch engaging the contacts, a key for actuating the switch, and means for engaging and moving the contacts out of operative relation with the switch.

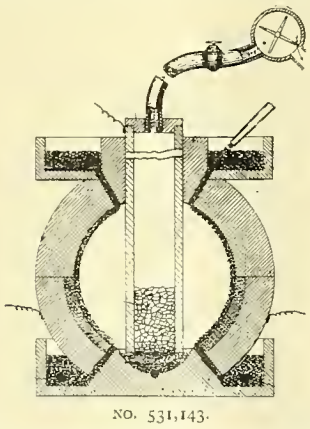
531,078. Telephone Speaking Tube System. Thomas C. Wales, Jr., Boston, Mass. Application filed April 7, 1894.

This is a telephone speaking-tube system comprising a plurality of stations. There is a plurality of circuits, a common source of electricity, and a call wire, the circuits extending to each station and provided with normally open branch terminal switches or spring-jacks, one for each circuit the inner springs of which are connected to the respective conductors of the home circuit, and the outer springs are connected to the respective conductors of the associated circuits, with a plug connector, and telephones in a normally open bridge of the home circuit, and branches from the circuit conductors to the source of electricity, one of each pair having included therein an electro-magnetic resistance. Upon the insertion of the plug connector into a spring-jack, and the removal of the telephone from the hook switch, the home circuit is linked to a distant station, and the telephones are automatically bridged into the circuit.

531,130. Electrical Switch Setting and Locking Device. Karl Moleregger, Vienna. Austria-Hungary. Application filed February 8, 1893.

The invention is described as the combination with a railway switch, comprising switch rails, a screw shaft, a nut adapted to travel along the screw, and connections between the switch rails and nut, of an electro-motor coupled to the screw shaft for rotating it, and electric switch devices coupled with the motor and the switch rail actuating mechanism, whereby as the switch is set over in one direction by operation of the mechanism, the contacts will be automatically readjusted in readiness to reverse rotation of the screw shaft on the next passage of the current through the motor.

531,143. Apparatus for Electric Heating, Smelting and Separating. Joseph W. Woodfolk and John C. Wharton, Nashville, Tenn. Application filed December 12, 1893.



NO. 531,143.

The device, as shown in the above cut, is an electric heating and smelting apparatus, having means for circulating a body of water, and the chief features are the hollow electrode through which the material to be treated is fed, the electrode surrounding the hollow electrode and through which the water circulates, and the connections from an electric source to the electrodes.

531,146. Signal Lamp for Electric Railway Cars. Charles H. Baker, Detroit, Mich. Application filed April 24, 1894.

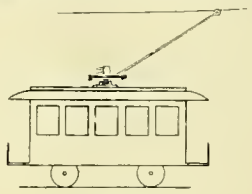
The illustration shows a trolley support of an electric railway car, an electric signal lamp inclosed in the casing secured to the rotary support of the trolley arm, and having one terminal of the lamp in electrical contact, an arm secured to the lamp casing constituting the other terminal of the lamp, and a fixed contact ring with which the arm is adapted to form a traveling electric contact, the contact ring forming one terminal of the lamp circuit on the car.

531,153. Electric Meter. Theodor Bruger, Bockenheim, near Frankfort-on-the-Main, Germany. Application filed June 22, 1894.

Claim 1 follows: In alternating current meters, the combination of a shunt electro-magnet arranged in parallel circuit with the lamps, an armature arranged between and in line with the pole ends of said shunt electro-magnet, a rotary metallic cylinder inclosing the armature, and a main electro-magnet within whose field the cylinder and its inclosed armature are located, said field intersecting the field of the shunt magnet, and said main electro-magnet being arranged at such a distance from the armature that the phase movement between the two fields is as great as possible, the interval of proportionality between the current and velocity being within broad limits, and the damping by Foucault current rendered very effective and independent of the main current.

531,194. Telephone Transmitter. David A. Kusel, St. Louis, Mo. Application filed August 6, 1894.

Here is the claim: The combination of the diaphragm holder, having opposite perforated ears projecting a distance beyond its rear edge, clamping screws extending in alignment and threaded into said ears, with their headed ends outward, an internal annular flange or shoulder on said holder, to support the diaphragm some distance in the rear of the front piece of the transmitter box a diaphragm, a clamping ring loosely mounted in rear of said diaphragm and provided with diametrically opposite projections, having inwardly and rearwardly converging or inclined surfaces, which are engaged by the inner ends of said clamping screws, whereby when said screws are moved toward each other they will forcibly engage said inclined surface of said ring and urge the latter forward into intimate contact with said diaphragm, an electrode adjacent said diaphragm, and suitable connections



NO. 531,146.

531,214. Electric Safety Appliance for Railroads. Elward L. Orcutt, Somerville, Mass. Application filed November 2, 1893.

A track circuit formed in part of the rails of the track, and a parallel or actuating circuit so arranged that the charging or breaking of one circuit will close or break the other, and a contact plate in each circuit, a source of electricity, a closed track circuit charging circuit, a closed parallel or actuating circuit charging circuit, and a closed train-controlling circuit on the train switching or looping brush in the track circuit charging circuit, and in the parallel or actuating circuit charging circuit to engage respectively the contact plates in the track circuit and parallel or actuating circuit to loop the latter circuits into the former when the brushes engage the plates, and mechanism operated by the breaking of either circuit to stop the train.

531,268. Brake and Power Controller for Electric Cars. Andrew W. Mitchell, Boston, Mass. Application filed January 22, 1894.

A brake rod of a car, having a handle or wheel, a gear on its lower end, a rack bar arranged to slide back and forth in suitable guideways to engage with the gear, another gear on a suitable support arranged to engage with the rack bar, a sprocket wheel connected to the latter gear or its journal, and a chain engaging with the sprocket wheel and with the rheostat or electric controller of an electric motor.

531,275. Street Car Motor. John Radomski, Baltimore, Md. Application filed July 13, 1894.

The combination comprises two track rails, rollers on the roadbed between the two track rails arranged in two longitudinal lines and spaced apart, a car provided with flanged wheels to traverse the track rails, a transverse bar underneath the car, and a pressure frame below the car axles, and having one end hinged to the transverse bar and the other end free to be raised or lowered.

531,284. Electric Block Signaling System. Adoniram J. Wilson, Port Chester, N. Y. Application filed May 14, 1894.

A track block is divided into subsections, a track circuit being provided for each subsection, a normally de-energized signal circuit for the block, means for energizing the signal circuit in the rear of the block, and means for de-energizing the signal circuit upon a change in the electric condition of each of the track circuits of the block, two or more of the track circuits being so connected together that when one of them is operated another is also operated to affect the signal circuit, a switch for the block, and an indicator therefor, a circuit for operating or controlling the indicator, and means for operating the indicator circuit located in the rear of the indicator.

531,288. Incandescent Electric Lamp Socket. Charles H. Balsley, Connellsville, Pa. Application filed April 20, 1894.

In this electric lamp socket the body is provided with a transverse septum a lamp clamp, a conductive part, make-and-break mechanism between the lamp clamp and conductive part, a lamp head connecting part projecting through the septum in electrical connection with the conductive part, a cap adapted to be secured to the body and provided with line wire connections, and conductive plates in electrical connection with the line wire connection, and adapted when the cap is secured to the body to be in contact with the conductive parts therein.

531,291. Guide for Trolley Wheels. William H. Dickerhoof, Cincinnati, O. Application filed July 23, 1894.

A trolley is described having its axis mounted on bearings and capable of a vibratory movement thereon independent of the movement of the bearings, guide arms connected with the axis and pivoted to the bearings, and a yielding connection between the guide arms and the bearing supports.

# No Solution Yet.

### The Electrician's Wooing.

My darling, wire you so cold?
Prey let my ohm be thine;
This system me a joy to hold
And pressure hand in mine.

Though you may search from pole to pole,
You'll find that I ampere
Of anyone, so let us join,
No motor part, my dear.

The gold our station will demand,
Our needs to gratify,
The circumstances I am in
Can descently supply.

The current of my thought is toward
One central lamp of bliss,
One heart I volt of there to cling
Need dynamo's it is?

So let us haste to lay our views
Before your pa and ma,
But if they their consent refuse,
Let's skip the trolley-is.

Of all the replies, good, bad and worse, that came floating to us through the sizzling summer air, not one seemed to approach a rational solution of the lines. We really thought better of our friends; however, the efforts were commendable, and we've had no end of fun over it. Rather the best thing that came to hand was the one published below.

It is from the wilds of Manhattan Island, and is fraught with a scintillant meter that entitles the author to rank along with Jim Riley, Ben King, Bill Nye and the Atlanta Constitution paragrapher.

### The Maiden's Reply.

The maiden read with glad surprise
The lines above, as quoted,
And telephoned the gentleman
Below, as will be noted.

"Unit my heart to yours, dear sir,
I offer no resistance,
And come watt will, I'm yours from date,
That is, with some assistance.

There's bare and bolts between us, dear,
For pa's opposed to sparking,
And keeps a dog to scare away
All gentlemen, by barking.

My ohms surrounded by a wall
That's made of brick and clay, sir;
I ne'er could climb it e'en for you,
For I'm not built that way, sir;

But could you get a pole somewhere
(Long double poles are better),
And place them both against the wall,
Advising me by letter?

Why then, I'd ready be for you;
On top the wall we'd meet, dear,
And gently sliding down the poles
We'd land upon our feet, dear.

And once outside this horrid wall
Which keeps us now asunder,
We'd laugh at bars and McKinlocks,
And married be—by thunder."

# Extract from a Paris Letter.

* * * * * *

This is the type of a man that the weather never wrinkles. He is as impregnable to the scorching rays of a July sun as he is to the importunities of his foreign son-in-law. He is quite an aggravating atom in the social fabric, he is so cool while every other body is fairly roasting.

No not **every** body—some of the smart set have provided themselves with one of those delightful American inventions, a fan-motor. Next to an egg-nog, also an American invention, I think they are deserving of unusual favor; doubtless Mr. Lundell, the inventor, will be elected one of the Society of Immortals. I have seen these fan-motors in all the swell resorts and cafés, and they are simply ubiquitous on the avenue des Arcadias in the Bois.

You will naturally want to know where they can be purchased. I think a Chicago firm, The Central Electric Co., have them for sale in America.

This evening I am going to lunch with a delightful little creature at the Café Chinois, and afterward we will take a spin on a bicycle.

* * * * * *

This melting heat ought to be sufficient argument in favor of Fan-Motors—we've got every imaginable kind to suit you and your customer—don't disappoint him by putting up an inferior kind. The **best** is Lundell's.

Our stock of construction material, tools and supplies was never more complete than now—our catalogue is an epitome of the higher grades of electrical merchandise. If not already in possession, get one.

# THE HELIOS LAMP FOR STREET LIGHTING.

A. L. WARFEL, President. O. P. FOOTE, Vice President. W. H. MOOREHOUSE, Secretary.

Knoxville Electric Light and Power Co.

Knoxville, Ill., Feb 5 1894

Helios Electric Co
Philadelphia Pa

Gentlemen,- Your inquiry in regard to the Helios arc lamps received, and in reply would say that we are using 26 of your lamps for street lighting purposes and they are giving very good satisfaction. The lamps we are using are your regular half arc lamps. There was a test made a few days ago by an expert, and he gave his opinion that the lamps were giving the rated candle power. We would recomend them to any one desiring to use a street lighting system and especially where coal is dear. it would be much more economical to use the Helios lamp from the incandescent machine than to use a separate arc machine.

Yours truly
Knoxville Elec Lt & P Co.

**DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.**

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

**HIGH-SPEED BELTED SIEMENS DYNAMOS**
Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

**ALTERNATING AND MULTIPHASE CURRENT DYNAMOS**
With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

**MOTORS**
Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H.P. Durable and economical in operation.

**SIEMENS BAND LAMPS**
For direct and alternating current, for constant potential and series machines.

**SIEMENS ARC LIGHT CARBONS**
With either solid or soft cores, which are the most economical in the world and give a steady light.

**ALL INSTRUMENTS**
Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

**Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents.**

THE

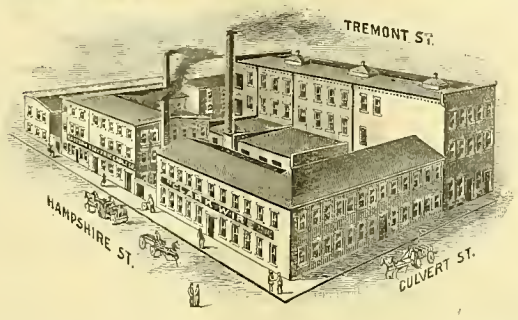
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# Analysis of Sal Ammoniac.

J. B. WEIS,
Analytical and Consulting Chemist
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

THE WONDERFUL

## D'Unger Telephone.

**Highly Important to Telephone Users.**

**BEWARE OF INFRINGING!**

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575,** granted Oct. 2, 1888, which is not only the **first,** but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field** It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

**D'Unger Long-Distance Telephone Co.,**
**Palmer House,** CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

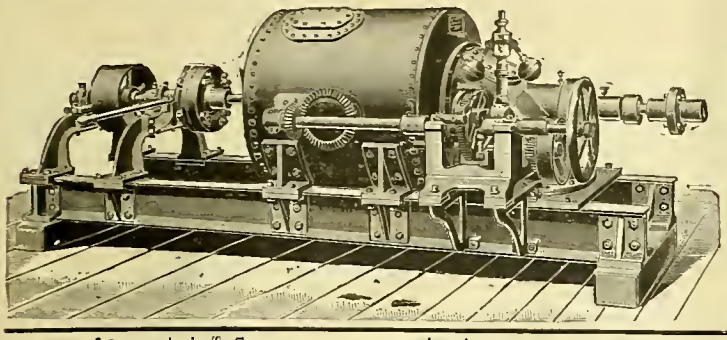
# VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its remarkably steady motion, high speed and great Efficiency, and Large Capacity for its diameter, being double the Power of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent. of useful effect **guaranteed.** SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of of 12-inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

**STILWELL & BIERCE MFG. CO., • Dayton, Ohio.**

---

**IF IF IF IF IF**

A word of only two letters, generally of no importance except for its conjunctive properties, but sometimes having such an important bearing that it feels itself as big as the initiative word to the German language, *i. e.*:

Constantinopolitanischerdudelsackspfeifermachersgesell

for example.

**IF**

I have to guarantee my work I always use the Law Double Cylinder Cell.

**IF**

I wish a cell that will give me a "dead cinch" on Holding-up power in combination with Uniformity of Current, which is bye-the-bye significant of eventual economy, I always purchase the Law Double Cylinder Cell.

**IF**

There is a Telephonist, Bellhanger, Railroader, an Electrician, or anyone else who denies the Efficiency, Durability or Capability of the Law Double Cylinder Cell, I challenge him to open debate.

Trusting that we have made clear to you through above remarks of a customer of ours the importance at times of the little word under consideration, we are yours truly,

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

### PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors —Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21 ...Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

### PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

### PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

### PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A.M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago, Illinois.**

# ELECTRICITY FOR ENGINEERS.

## Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

**WHEN ORDERED TOGETHER PRICE IS $2.50.**

*Both Works Profusely Illustrated.*

☛Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

### PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes—Troubles with Commutators and Brushes — Correct Position of Brushes — Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

### PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

# YOU NEED THESE BOOKS.

## NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages. 138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages. 42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS. "TRAMS."

*Their Construction, Operation and Maintenance.*

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## *THE PRACTICAL MANAGEMENT OF* DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.

*Experiments with Alternate Currents.*

By Nicola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embracee works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

**SEND IN YOUR ORDER.**

*Kester Arc Lamp.*

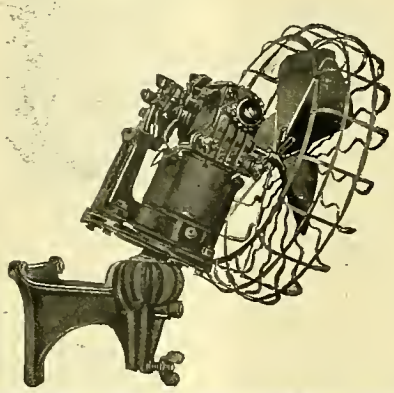
*Vulcanized Sheet, Rod and Tubing.*

*Xntric Switches.*

*Kester Commutator Compound.*

*Knox Circuit Breaker.*

*Garton Lightning Arrester.*



Crocker-Wheeler Bracket Fan Motor.

Our bracket fan, which is undoubtedly the greatest novelty in the Fan Motor line this year, is arranged so that the motor may be thrown in any position. This convenient arrangement has been secured by mounting the motor on a bracket fitted with a ball and socket joint. The bracket is arranged to be screwed on the wall and then by simply turning a thumb-screw the motor can be adjusted to any desired angle, and a breeze thrown to any part of the room.

We carry a large stock of these fans on hand, but so that your orders may be promptly filled, we would suggest that you place them early and not wait until the hot weather when there might be some slight delay.

We have Desk Fans also.

*N. I. R. Wires, Cables, Tape and Lamp Cord.*

*"Metropolitan" Incandescent Lamp.*

*I. X. L. Triple Braid Weatherproof Wire.*

*Crocker-Wheeler Fan Motors.*

*Dayton Electric Ceiling Fans.*

*Chicago Spark Arrester.*

Harrison International Telephone.

**We either sell our telephones outright or lease them for a term of years.**

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

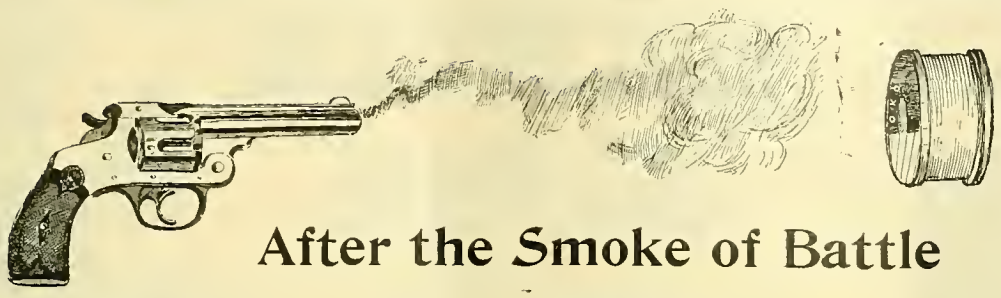
ELECTRIC LIGHT and RAILWAY PIPE POLES A SPECIALTY.



OKONITE TRADE MARK.

## After the Smoke of Battle

has cleared away you will find **Okonite** just where it has always stood—in the front rank—ahead of all others—unscathed. No matter how hard the conflict, nor what the service, nor where the rub comes, you can safely send Okonite and Candee Wires into the thickest of the fight, depending upon them to *win.* THEY NEVER DISAPPOINT.

**Body Guards?** Well, these wires don't particularly need any, but if you aim for the highest mark of safety, use INTERIOR CONDUITS. The pioneer of conduits, nothing equals it for absolute insulation, for convenience of interior construction. Nothing stands so high in the estimation of leading Engineers, Wire Workers and the Underwriters.

**In these hot times**

Nothing will cool things off so effectually as a LUNDELL FAN. Perhaps you haven't sent us the order we are looking for—*do it to-day.* We can supply every size for any purpose, from blowing up a derelict governor to cooling off a hot-headed rioter.

**House Goods**

We have the largest stock—the most perfect assortment of Electrical House Goods. If you are going to bid on a contract, consult our Catalogue first.

# THE HELIOS LAMP FOR STREET LIGHTING.

A. L. WARFEL, President. O. F. FOOTE, Vice President. W. H. MOOREHOUSE, Secretary

Knoxville Electric Light and Power Co.

Knoxville, Ill., Feb 5 1894

Helios Electric Co
Philadelphia Pa

Gentlemen,- Your inquiry in regard to the Helios arc lamp received, and in reply would say that we are using 24 of your lamps for street lighting purposes and they are giving very good satisfaction. The lamps we are using are your regular half arc lamps. There was a test made a few days ago by an expert, and he gave his opinion that the lamps were giving the rated candle power. We would recomend them to any one desiring to use a street lighting system and especially where coal is dear it would be much more economical to use the Helios lamp from the incandescent machine than to use a separate arc machine.

Yours truly
Knoxville Elec Lt & P Co.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

**Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems, Colored Glass Insulators to designate different currents.**

THE

# "CLARK" WIRE.

TRADE MARK.

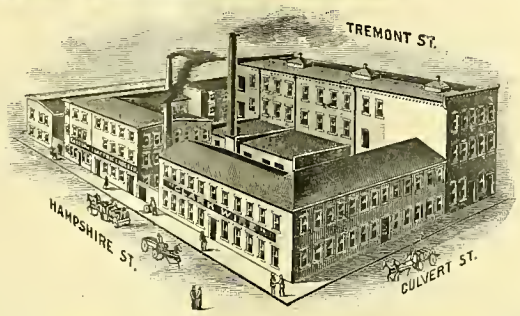
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**

**GREAT WESTERN MFG. CO.,**

**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

THE WONDERFUL

## D'Unger Telephone.

**Highly Important to Telephone Users.**

**BEWARE OF INFRINGING!**

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575,** granted Oct. 2, 1888, which is not only the **first,** but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-clearing telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field** It has likewise Paul D'Unger's Patent Diaphragm Regulator which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

**D'Unger Long-Distance Telephone Co.,**
**Palmer House,** CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

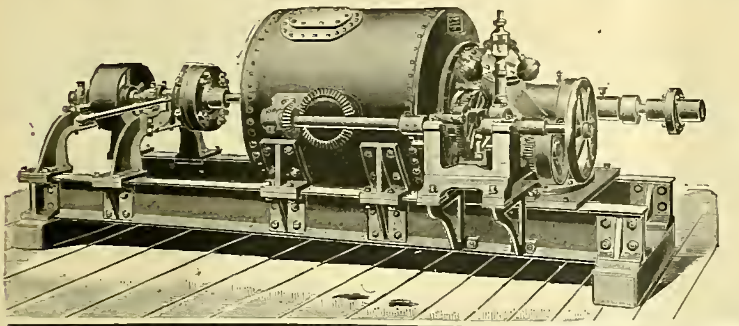
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

---

**IF IF IF IF IF IF**

A word of only two letters, generally of no importance except for its conjunctive properties, but sometimes having such an important bearing that it feels itself as big as the initiative word to the German language, *i. e.*: Constantinopolitanischerdudelsackspfeifermachergesell for example.

**IF** I have to guarantee my work I always use the Law Double Cylinder Cell.

**IF** I wish a cell that will give me a "dead cinch" on Holding-up power in combination with Uniformity of Current, which is bye-the-bye significant of eventual economy, I always purchase the Law Double Cylinder Cell.

**IF** There is a Telephonist, Bellhanger, Railroader, an Electrician, or anyone else who denies the Efficiency, Durability or Capability of the Law Double Cylinder Cell, I challenge him to open debate.

Trusting that we have made clear to you through above remarks of a customer of ours the importance at times of the little word under consideration, we are yours truly,

# YOU NEED THESE BOOKS.

NEW
## DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages.* *138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

**Fourth Edition.** **Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages.** **42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS.
"TRAMS."
*Their Construction, Operation and Maintenance.*
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages.* *Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS,
**TERMS AND PHRASES.**
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages.** **750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

*THE PRACTICAL MANAGEMENT*
OF
## DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
**Engineers and Architects.**
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages.* *Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.
*Experiments with Alternate Currents.*
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

# ELECTRICITY FOR ENGINEERS.

## Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

**WHEN ORDERED TOGETHER PRICE IS $2.50.**

*Both Works Profusely Illustrated.*

**Just the Work for Engineers, Electricians, Dynamo Tenders, etc.**

## PART I.—CONTENTS.

CHAPTER I.

Electricity —Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets —Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

## PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp —Diagram of Circuits in Lamp—Action of the Mechanism —Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp —Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

Crocker-Wheeler Bracket Fan Motor.

Our bracket fan, which is undoubtedly the greatest novelty in the Fan Motor line this year, is arranged so that the motor may be thrown in any position. This convenient arrangement has been secured by mounting the motor on a bracket fitted with a ball and socket joint. The bracket is arranged to be screwed on the wall and then by simply turning a thumb-screw the motor can be adjusted to any desired angle, and a breeze thrown to any part of the room.

We carry a large stock of these fans on hand, but so that your orders may be promptly filled, we would suggest that you place them early and not wait until the hot weather when there might be some slight delay.

We have Desk Fans also.

ELECTRIC LIGHT and RAILWAY PIPE POLES A SPECIALTY.

DOUBTLESS many such experiences, as the one related in the next column, could be given, but electrical engineers have become so accustomed to doing battle with the elements, and so used to depending upon Okonite to carry them through a "tight pinch" that they think nothing of it and hold their peace.

Our friend Mr. Crews crows over his a little, but at the same time manfully holds his piece—several of them in fact—and still has his cable peacefully doing duty, slightly disfigured perhaps but still in the swim.

The story points its own moral ☞ OKONITE TRADE MARK.

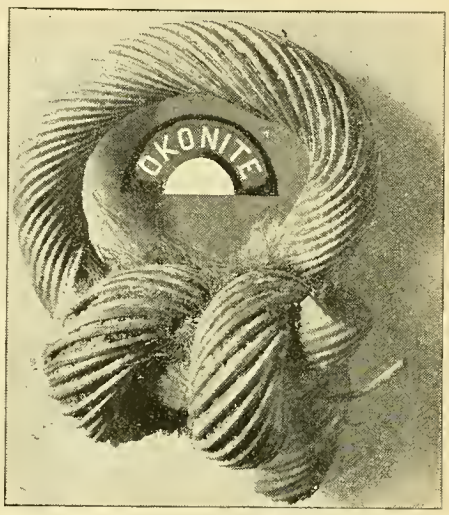
# A Badly Twisted Cable.

**A Story Which Seems to Prove That While an Okonite Cable May at Times Become very Knotty, in Fact Engage in an Occasional Snarl, It Never Neglects to Attend Strictly to Business.**

To the Editor of *Electrical Review:*

In compliance with your request, I will endeavor to give you an account of the tronble we had in Hampton Roads when the knot in the Okonite cable I recently sent you was made. The particular specimen sent you, and of which you have had an excellent cut made, was not much worse than some five or six others made at the same time.

In June, 1892, the Southern Bell Telephone and Telegraph Company laid a telephone cable in Hampton Roads, between Old Point Comfort and Willoughby Sand Spit (three miles), touching at Rip Raps, the old stone pile so familiar to every visitor to Fortress Monroe. The Rip Raps is just one mile off Old Point and two miles off Willoughby Spit, and is availed of as a test station for the cable.



The cable worked beautifully until the memorable freeze of January, 1893, when this section experienced the most protracted spell of severely cold weather felt in 40 years, to say nothing of the proverbial "oldest inhabitaut." Hampton Roads was gorged with ice from shore to shore, and between Old Point and Rip Raps (the channel) many vessels dragged their anchors for a week. The staunchest ships were helpless; they dragged anchors to and fro with the tide and ice. Vessels would go out half a mile and back again, and this see-sawing went on, with our cable right in the track of the anchors. The cable was broken the first day of the ice gorge. Further than that, the Old Point end had been pulled out and carried away. We knew nothing more as to the extent of the damage until the ice went out sufficiently (a week later) to enable us to reach Rip Raps, when we found the Rip Raps end still holding. We were provided with a commodious barge and strong tug boat alongside to handle it. We took aboard the Rip Raps end and reeled toward the other end of this piece of cable, which we found about 1,800 feet away. We now had 1,800 feet of cable safely reeled up and the rest of it at the bottom of the deep blue sea, but just where only Mr. McGinty could have answered. We proceeded to Old Point, tied up the barge and went to dragging with grapnels for the missing cable. We found piece after piece until we had four or five pieces, but this was not all, and drag as we would, we could find no more. We raked every foot of bottom within half a mile of where the cable had lain. A week or so after we had abandoned our search, and when getting ready for new cable to replace what was missing, a tug anchored just outside the limits of our "scratching," and when she wanted to leave, could not get her anchor at first, but finally succeeded in raising it to the surface, with the missing cable hanging on. The tug people slipped the cable, buoyed it and notified us. We recovered it the next day, and it was in this piece we found the puzzling knot sent you. We spliced up the pieces and with 600 feet of surplus cable we had in stock, relaid it and re-established service. We now had six splices in this cable, but it worked just as well as when first laid new, and has continued to do so, except for an interruption last November, when a ship's anchor broke it. This break was repaired next day, and to-day the cable is as well insulated as when first laid.

The mechanical injury to the armor of the cable was so severe at some places, that on cutting out the damaged section we were surprised to find the conductors in good condition, and the insulation unhurt. The conductors and insulation in the curious snarl of which you have had a cut made are perfect, notwithstanding the evident strain to which this piece of cable was subjected. Very truly yours, J. W. CREWS,

*S. Bergmann, Esq., President.*

*Dear Sir:*

*We are pleased to testify to the entire satisfaction afforded us by the installation of your incandescent arc lamps, which you supplied for our establishment last year.*

*We hove about 500 of them in use throughout our entire building, and the lighting is beyond criticism. The lamps are also very sightly in appearance and make handsome fixtures. The light is absolutely steady and agreeable, and particularly well adapted to show off goods like ours.*

*Having now had the lamps for a sufficient length of time to feel every confidence that they will continue to give the same good service, we take pleasure in recommending them to be what you claim for them in all respects.*

*We also beg to express our appreciation of the promptness and ability with which you carried out your contract with us, which called for the installation of a larger number of lamps than had ever been grouped together in one building before in such a short time.*

*We feel that we could not have entrusted the work, which was at that time a matter of the greatest importance to us, to any other concern and experienced the same entire satisfaction.*

*Yours very truly,*
*Hilton, Hughes & Co*

Read this testimony about the largest installation of Low Tension Arc Lamps in one building in the world, and if you are still unconvinced of the superiority of our lamps, visit the great mercantile house that gave it to us and see for yourself. Then send for our prices and you will give us your future orders.

# GENERAL INCANDESCENT ARC LIGHT COMPANY,

NEW YORK.

169 Adams Street, CHICAGO.

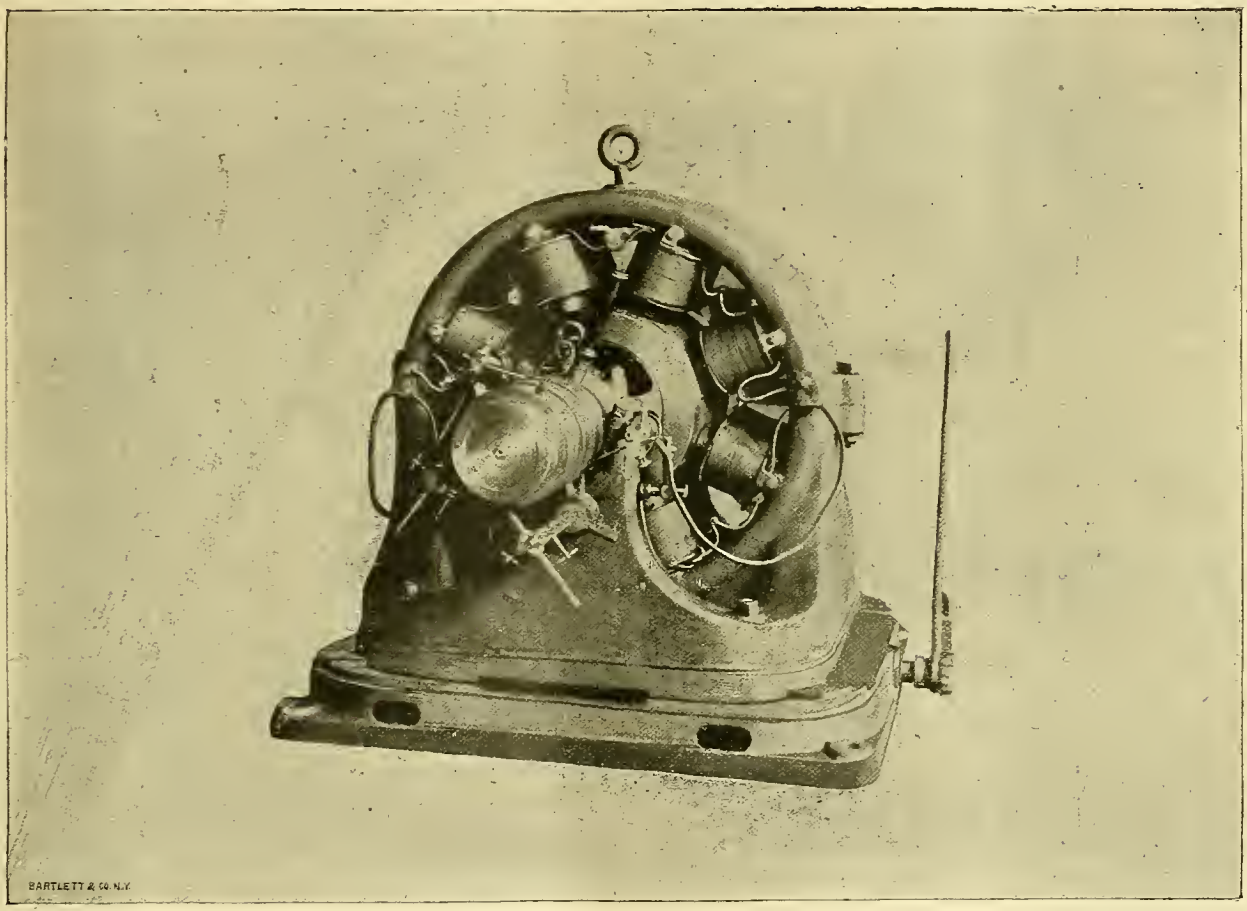
S. BERGMANN, President.

572 to 578 First Avenue, NEW YORK.

# Westinghouse Electric & Manufacturing Co.

**This Company, having the exclusive license to manufacture and sell multiphase motors and generators for long distance and other power transmission, under Nikola Tesla's numerous patents, has brought suits against the Thomson-Houston Company, the Redlands Company of California, the Granite State Electric Company of Concord, N. H. (all defended by the General Electric Company), and against the Stanley Laboratory Company, covering the form of apparatus manufactured by the Stanley Electric Manufacturing Company. These suits are being pressed with diligence so that there may be an early determination, which will enable us to promptly enforce our legal rights.**

**We offer a line of multiphase generators and motors unsurpassed in design and quality at such reasonable rates that there can be no occasion whatever for the use of apparatus made by unlicensed manufacturers.**



The World's Columbian Exposition was lighted by means of our multiphase generators, and the water-power of Niagara Falls will be transmitted by our multiphase generators in units of 5,000 horse power.

We have the best transformers at the lowest prices.

We offer 16 candle power stopper lamps, the best incandescent lamps ever made, at 25 cents each, with an allowance of 4 cents for each perfect bulb and stopper returned. Discount on large orders. A customer, in ordering more lamps, says: "Up to the present time not a stopper lamp has broken, and lots of them have burned over 1,400 hours." Send for illustrated catalogue.

Our electric street railway equipments are recognized as the standard.

# THE HELIOS LAMP FOR STREET LIGHTING.

A. L. WARPEL, President. O. F. FOOTE, Vice President. W. H. MOOREHOUSE, Secretary.

Knoxville Electric Light and Power Co.

Knoxville, Ill., Feb 5 1894

Helios Electric Co
Philadelphia Pa

Gentlemen, - Your inquiry in regard to the Helios arc lamp received, and in reply would say that we are using 26 of your lamps for street lighting purposes and they are giving very good satisfaction. The lamps we are using are your regular half arc lamps. There was a test made a few days ago by an expert, and he gave his opinion that the lamps were giving the rated candle power. We would recomend them to any one desiring to use a street lighting system and especially where coal is dear as it would be much more economical to use the Helios lamps from the incandescent machine than to use a separate arc machine.

Yours truly
Knoxville Electric L. & P. Co.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

**Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents**

Excursion tickets to the Summer Resorts of Wisconsin are now on sale by the Chicago, Milwaukee & St Paul Railway. Special low rates on Friday and Saturday of each week for tickets good to return until Monday. For further information apply at Ticket Office, 207 Clark St., or Union Passenger Station, Canal, Adams and Madison Sts.

THE WONDERFUL
## D'Unger Telephone.
### Highly Important to Telephone Users.
### BEWARE OF INFRINGING!

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.

The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field** It has likewise Paul D'Unger's Patent Diaphragm Regulator which prevents the words from ruoning together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address

D'Unger Long-Distance Telephone Co.,
**Palmer House,** CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

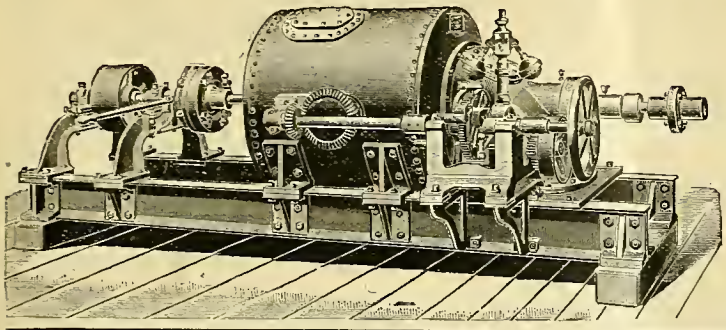
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

# THE LAW DOUBLE CYLINDER CELL,

**WE DO NOT DENY,**

Costs a little more than some other open circuit cells at the start, but owing to its great HOLDING-UP POWER and Uniformity of Current it eventually is the cheapest. As we manufacture various other types of open circuit cells we must be honest in asserting this.

ACID CELLS, PLUNGE BATTERIES, SAL-AMMONIAC, ZINCS.

**Carbon Plates.**

**LAW BATTERY CO.,**
85 John St., New York.

***The Standard Open Circuit Batteries of the World.***

SEND FOR CIRCULAR AND PRICES.

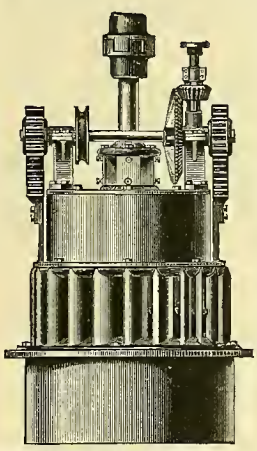
***111 to 117 East 131st St., N. Y.***

## GRAPHITE SPECIALTIES

**FOR ELECTRICAL USES.**

**Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the Inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.**

**JOS. DIXON CRUCIBLE CO., Jersey City, N. J.**



# THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

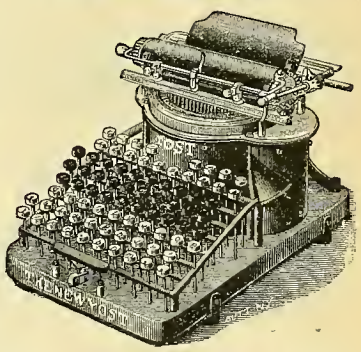
**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

## The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

Let us send you catalogue.

**The Yost Writing Machine Co.,**
**169 La Salle St., CHICAGO.**

# New York Insulated Wire Co.,

**Sole Manufacturers,**

Grimshaw White Core and Raven Core Wires, Grimshaw Underground Lead Covered Cables,

## JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

**THE JAMES LEFFEL & CO.** SPRINGFIELD, OHIO, AND NEW YORK CITY.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

☛Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

### PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

### PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. Postage Prepaid.

## THE HELIOS LAMP FOR STREET LIGHTING.

A. L. WARFEL, President. C. F. FOOTE, Vice President W. H. MOOREHOUSE, Secretary.

Knoxville Electric Light and Power Co.

Knoxville, Ill., Feb 5 1894

Helios Electric Co
Philadelphia Pa

Gentlemen,- Your inquiry in regard to the Helios Arc lamps received, and in reply would say that we are using 26 of your lamps for street lighting purposes and they are giving very good satisfaction. The lamps we are using are your regular half arc lamps. There was a test made a few days ago by an expert, and he gave his opinion that the lamps were giving the rated candle power. We would recomend them to any one desiring to use a street lighting system and especially where coal is dear as it would be much more economical to use the Helios lamps from the incandescent machine than to use a separate arc machine.

Yours Truly
Knoxville Elec Lt & P Co.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

THE

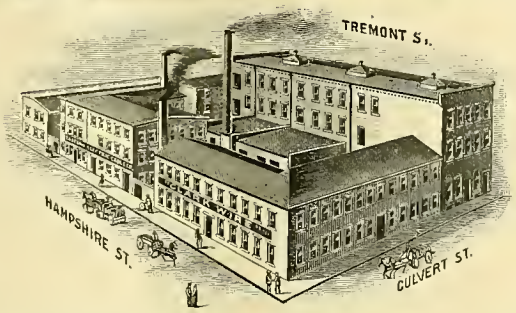
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**
**GREAT WESTERN MFG. CO.,**
**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE WONDERFUL
## D'Unger Telephone.
Highly Important to Telephone Users.

**BEWARE OF INFRINGING!**

The D'Unger Long Distance Telephone (the "Far-Away Talker") can now be had for use in Telephone Exchanges on a small annual royalty, and **on no other terms**. It is constructed under numerous patents, especially **Patent No. 390,575**, granted Oct. 2, 1888, which is not only the **first**, but **the only undisputed and indisputable valid patent granted for an All-Carbon Multiple-Contact Microphonic Telephone Transmitter.** All all-carbon multiple-contact telephone transmitters built without or under patents granted since Oct. 2, 1888, are **infringements upon Patent No. 390,575**—a fact to be borne in mind by persons contemplating the use of Telephones.
The "D'Unger" is the only self-cleaning telephone in the world. It sends speech one (1) mile or five thousand (5,000) miles in a perfectly clear manner; can be operated at half the ordinary expense; is always in order, and has for its Receiver a Patent Compound Magneto, making but **one magnetic field** It has likewise Paul D'Unger's Patent Diaphragm Regulator, which prevents the words from running together. As a whole it is complete, cannot be surpassed, and has no equal. Pronounced by all unprejudiced electricians to be the **Peer of Telephones.** Address
D'Unger Long-Distance Telephone Co.,
**Palmer House.** CHICAGO, ILL.

No D'Unger Telephones can be had for exchanges, except through me. R. D'UNGER.

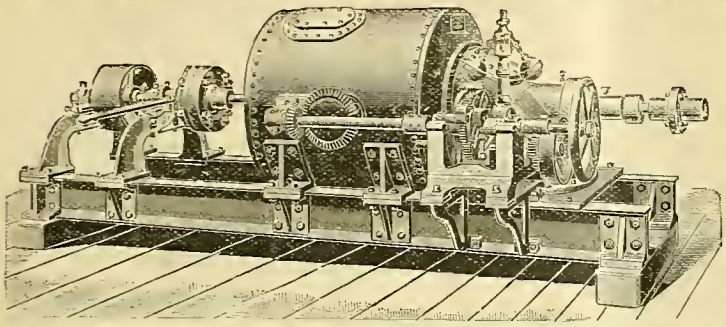
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

# THE LAW DOUBLE CYLINDER CELL,

**WE DO NOT DENY,**

Costs a little more than some other open circuit cells at the start, but owing to its great HOLDING-UP POWER and Uniformity of Current it eventually is the cheapest. As we manufacture various other types of open circuit cells we must be honest in asserting this.

ACID CELLS, PLUNGE BATTERIES, SAL-AMMONIAC, ZINCS.

# THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

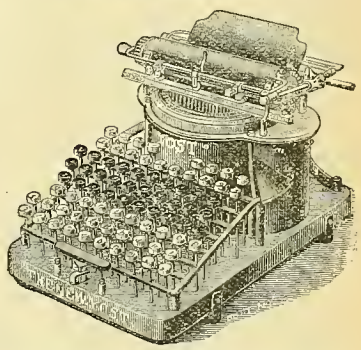
**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

# The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

Let us send you catalogue.

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

# WESTERN ELECTRIC CO., CHICAGO.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

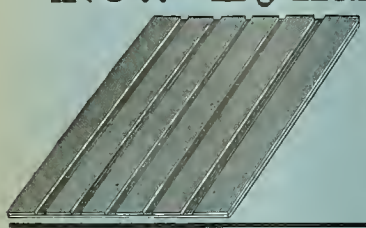
The Bolgiano Mfg. Co.,
415 Water St.,
BALTIMORE, MD.

---

## New Dynamo Belting.



Patent Grooved Belting having Grooves running lengthwise of the Belt, serve as channels to permit the escape of air between Belt and Pulleys, to each a degree that the air cushion is overcome and the Belt can be run very slack, thereby taking the heavy strain from the bearings.

SCHULTZ BELTING CO., St. Louis, Mo.

Agents in all Principal Cities.

BRANCHES:
164 Summer Street, Boston.

Helios Electric Co

Philadelphia Penn'a

Gentlemen:

In regard to the Helios Lamps we have in use on our Street-Circuit will say; We now have 26. 2000 C.P. Helios Lamps running on our Streets and giving good satisfaction. The first installation of 17 Lamps was made subject to acceptance by the City Council, and before they would accept the lights, they had an Expert test and report made. The Lamps was sustained as to Candle Power and General efficency. And the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds. They give a very clear steady white light, entirely free from the flaking and dying out of the ordinary Direct Current Arc Lamp.

Yours Truly
Barnes Bros

IMPROVED

# Construction Tools

## For Electric Light, Street Railways,

### Telephone and Telegraph Co's.

ABOUT this time of year a general inspection of lines and miscellaneous outside equipment is in order. Slack pulled in, poles reset, curves strengthened up, pins and insulators replaced, etc.

We invite Superintendents and Foremen to examine our complete and well selected stock of Construction and Repair Tools.

We have all the old standard tools and every new device of any merit.

**IMPROVED POST-HOLE AUGERS,**
**SHOVELS, SPADES, SPOONS, SCOOPS,**
**TAMPING, DIGGING AND CROW BARS, PICKS,**
**PLAIN SPIKED and CRESCENT PIKE POLES,**
**"JENNY" AND "MULE" SUPPORTERS,**
**CANT HOOKS, CARRYING HOOKS.**

We realize how important it is at times to get an immediate shipment of necessary tools. Many a time the wide-awake Manager finds it advisable to "steal a march" in order to protect rights of way, and often to repair breaks caused by storms, cyclones, floods, etc.

We hold ourselves in readiness to "railroad" orders with a neatness and dispatch to satisfy the most urgent demand.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

**Standard Screw Glass Insulators, Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems. Colored Glass Insulators to designate different currents**

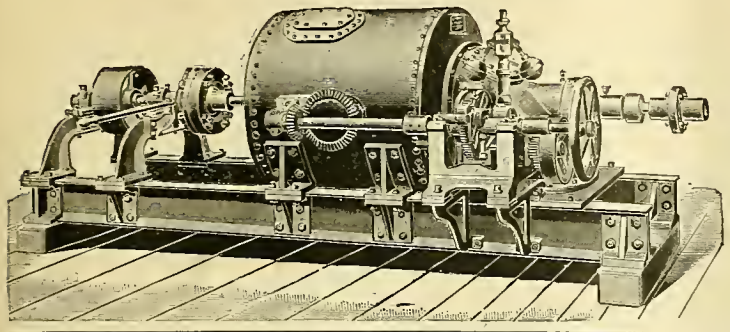
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

## THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

**THE JAMES LEFFEL & CO.** SPRINGFIELD, OHIO, AND NEW YORK CITY.

# YOU NEED THESE BOOKS.

NEW
## DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages.* *138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS.
"TRAMS."
*Their Construction, Operation and Maintenance.*
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages.* *Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Mesaill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages.* *Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.
*Experiments with Alternate Currents.*
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embracee works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

## PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes—Troubles with Commutators and Brushes — Correct Position of Brushes — Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

## PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Coonecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Helios Electric Co

Philadelphia Penn'a

Gentlemen:

In regard to the Helios Lamps we have in use on our Street Circuit will say, We now have 26. 2000 C.P. Helios Lamps running on our Streets and Giving Good Satisfaction, The first installation of 17 Lamps was made subject to acceptance by the City Council, and before they would accept the lights, they had an Expert test and report made, The Lamps was sustained as to Candle Power and General efficency, & the result was an order for 8 more Lights by the City and 1 by the County on Court House Grounds. They give a very Clear Steady white light, entirely free from the flashing and Jumping out of the ordinary Direct Current arc Lamp.

Yours Truly
Barnes Bros

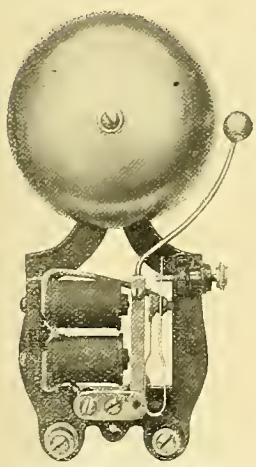
# One of the Beauties of Okonite

Is—well to tell the truth we are unable to discriminate. Okonite is possessed of so many rare qualities and is of such homogeneous merit that it would be a difficult task to point to this or that distinguishing feature and say, "herein is the chief virtue."

We doubt if there is, in the world, a man having any very intimate interest in Electrical Work who is not familiar with, if he has not actually used, Okonite Wire in some one of its many applications. There is but one way to account for such a precedence, for such universal appreciation—

**It never disappoints.**



This is the Contact Protected Dust-Proof Bell.

## Here is a Bell

That will meet the instant approval of every Contractor or Bell-fitter who has had to contend with the numerous difficulties in the way of assuring his customers uninterrupted service.

Nothing is more annoying than to be called a long distance just to chase a bug out of the contact-points, or to blow away a speck of dust. Various insect proof frames and boxes have been designed, but in each the really *vital* point was left unprotected. **In this bell** *the contact points are sealed.* No bug, no dust or other obstruction can prevent ringing. We have this bell in various sizes. Also a full line of House Goods Specialties, Annunciators, Batteries, Insulated Wires, Push Buttons and Construction Tools.

*Orders and correspondence given prompt attention.*

# Kerite Wins Again!

33BM. Fd. Mi. 10Paid. 1:46pm

*Received at* Main Office, Cor. Clark & Jackson Sts., Chicago. (WHERE ANY REPLY SHOULD BE SENT.)

New-York, Aug. 2-94.

Cushing & Morse, 225 Dearborn St, Chicago, Ill.

Have highest award on insulated electric light wire.

Worlds Fair.

W. R. Brixey.

Prof. Henry S. Carhart of Ann Arbor University, Prof. D. C. Jackson of Wisconsin University, appointed by the World's Fair Commission to test and investigate the various insulations, have, after nine months or more of the most exhaustive research, pronounced ***Kerite superior to all others.*** This is what they say in their report:

W. R. BRIXEY,
New York, N. Y.

GROUP 126; CLASS 769—KERITE INSULATED WIRE FOR ELECTRIC LIGHT SERVICE.

## AWARD.

First. ***HIGHEST*** excellence in insulating qualities.
Second. Durability of insulation under conditions found in commercial service.
Third. Uniform high excellence in mechanical qualities of insulation.

NOTE.—This report is based upon the results of exhaustive tests approximating the various conditions to be met with in practice by insulated wires in electric light service.

D. C. JACKSON, Individual Judge.
HENRY S. CARHART, President Department Committee.

These facts, together with the favorable testimonials of thousands who are using ***Kerite*** to-day, fully substantiate our claims that

## KERITE INSULATED ELECTRIC WIRES AND CABLES

Will out-test and out-class any other on the market

# BUILDING AND INSULATING PAPER

**Manufactured under U. S. PATENT No. 378,520.**

**The validity of this Patent has been judicially established in the case of**

## The Standard Paint Co. vs Henry J. Bird and James L. Reynolds,

Where, after an exhaustive litigation extending over four and a quarter years, and after consideration of a printed record of upwards of one thousand pages, the Circuit Court of the United States for the District of New Jersey, on July 5th, 1894, made and entered a decree adjudging that the Patent was valid and had been infringed by the defendants and directing an injunction against the defendants and an accounting.

The opinion of the Court written by Hon. George M. Dallas, Circuit Judge, holds that the Patent covers any Paper coated with a solid residuum obtained from the distillation of Petroleum and that the manufacture and sale of any substantially similar paper is an **INFRINGEMENT** of the Patent.

The coating mentioned, and which, as established by the evidence in the case and by decree of the Court, was first used by this Company and protected by the U. S. Patent referred to, makes an ***Odorless, Water, Acid and Alkali Proof,*** and thoroughly ***Insulating Paper,*** as is well-known.

The Court holds that Papers possessing these essential characteristics, which were new up to the time of their introduction under the name of ***P. & B.,*** made by others, a violation and infringement of our rights.

We beg to caution the public against the purchase of such infringing papers, as we shall enforce our rights in every instance.

Our prices remain the same as heretofore, and ***the best paper,*** the ***P. & B.,*** can be had from us, on short notice, and in any quantities.

**The Standard Paint Co., New York,**

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

THE

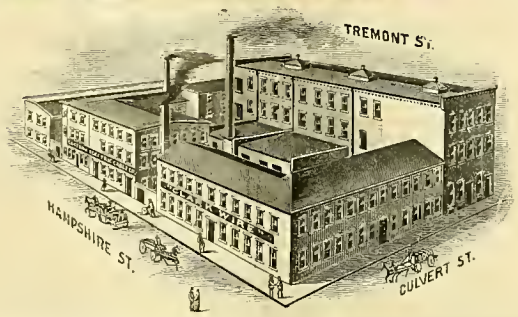
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

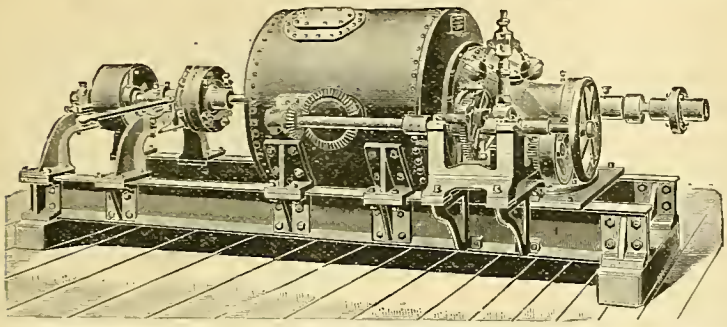
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

Factory,
ADRIAN, MICH

We are now prepared to sell outright Telephones, Magneto Transmitters, Magneto Bells, Telephone Switchboards and Apparatus.

The Gilliland Telephone Company is incorporated and thoroughly organized for the further purpose of constructing Telephone Exchange plants, building private lines, or equipping Hotels, Factories, Resident Apartments or Department Stores with a complete Telephone speaking tube system. Our Telephone set consists of Magneto Call Bell, Desk and Back-board, Hand Receiver with Cord and Bi-Polar Magneto Transmitter, neatly and compactly put together in a style familiar to the public, and our aim has been to supply a Telephone which will give satisfaction both electrically and mechanically. In principle of construction, those features are embodied which experience in Telephone service demonstrate to be the most efficient and reliable. Complicated mechanism has given place to simplicity of construction, and our Telephone set as it stands to-day is without doubt the best instrument yet offered to the public. Telephone experts who have made careful and thorough tests verify this statement and unhesitatingly pronounce our Telephone absolutely first-class.

We employ men of experience and ability for the purpose of Telephone Exchange construction and electrical work, and are prepared to furnish estimates promptly, or contract for electrical work at once. Correspondence solicited.

You have seen our special offer on 1,000 "Ward" lamps, direct current. Well, the sale is fairly under way. If you desire anything in this line, let us hear from you quickly. State full particulars and quantity that you wish figures on.

## Electric Construction & Supply Co.,

Telephone Building, New York.

Established 1881.

Unity Building, Chicago.

---

# BUCKEYE INCANDESCENT LAMPS

Monadnock Building, Chicago.

## TO FIT ANY STANDARD SOCKET.

Judge Ricks' decision against the Edison Company and in our favor, frees these lamps from any taint of infringement. Order no other.

THE BUCKEYE ELECTRIC CO., Cleveland, O.

# Western Electrician

$3 per Annum. Copyright, 1894, by Electrician Publishing Company, Chicago. EVERY SATURDAY. Entered at Chicago Postoffice as mail matter of the second class. 10 cents per Copy.

Vol. XV. CHICAGO, AUGUST 18, 1894. No. 7

MASS. INSTITUTE OF TECHNOLOGY 1894 LIBRARY.

## BRISTOL'S RECORDING VOLTMETERS

and Recording Pressure Gauges Pay for Themselves

In every Electric Light and Electric Power Station, by making continuous records day and night of voltage and Boiler Pressure.

SENT ON 30 DAYS' TRIAL AND FULLY GUARANTEED.

Circular and Fac-simile Chart mailed on application.

THE BRISTOL COMPANY, - - WATERBURY, CONN.

## "NEW BEACON" INCANDESCENT LAMP.

(N. & C. Patents.) 16 C. P. (Barrel Lots) 25 Cts.

Beacon Vacuum Pump & Electrical Company,

CHICAGO OFFICE, 928 Dearborn St. PHILADELPHIA, OFFICE, 305 Hale Bldg.

Manufacturers, Irvington Street, BOSTON, MASS.

## Aetna Railway Insulators, Anderson Line Material,

Manufactured solely by ALBERT & J. M. ANDERSON, 289 to 293 A Street, Boston, Mass.

Correspondence Solicited.

## PARTRIDGE CARBON CO.

Sandusky, Ohio.

Send for Samples.

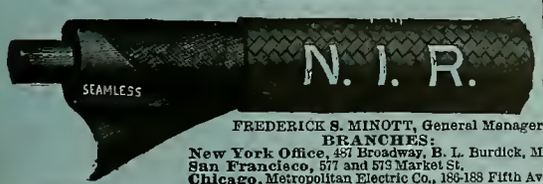
## Motors and DYNAMOS

Forged Iron. Adams Patents.

E. C. BERNARD CO.,

Manufacturers,

Troy, N. Y.



## National India Rubber Co.'s Wires and Cables.

FREDERICK S. MINOTT, General Manager.

BRANCHES:

New York Office, 451 Broadway, B. L. Burdick, Mgr.
San Francisco, 577 and 573 Market St.
Chicago, Metropolitan Electric Co., 186-188 Fifth Ave.

Factory and Offices: BRISTOL, R. I.

WILLARD L. CANDEE, H. DURANT OHEEVER, } Business Managers. GEO. T. MANSON, Gen'l Supt. W. H. HODGINS, Secretary.

## THE OKONITE COMPANY, LIMITED,

13 Park Row, New York.

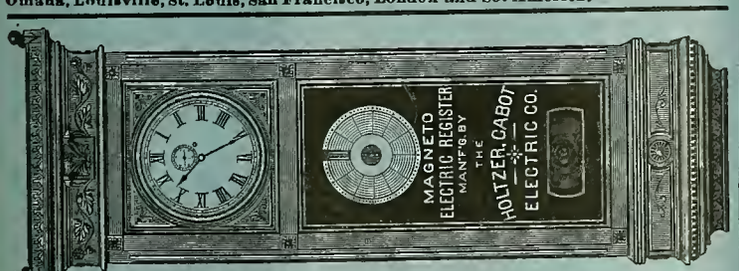
INSULATED

WIRES AND CABLES,

For Aerial, Submarine and Underground Use.

Candee Aerial Wires.
Manson Protecting Tape.
Okonite Waterproof Tape.

BRANCHES: Chicago, Boston, Philadelphia, Minneapolis, Cincinnati, Kansas City, Omaha, Louisville, St. Louis, San Francisco, London and So. America.



## MAGNETO WATCHMEN'S CLOCKS.

PRICES REDUCED.

Holtzer-Cabot Electric Co., 92 Franklin St., Boston, Mass.

New York Office and Salesroom, 114 Liberty Street.

## WHAT DO YOU THINK

Of an installation of 1,400 incandescent lamps burning on two minutes flash work from 10 a. m. to 11 p. m., from May 1 to Aug. 1, with only four renewals?

THESE WERE PACKARDS.

DON'T YOU WANT SOME?

*ELECTRIC APPLIANCE COMPANY, Western Selling Agents,*

242 MADISON STREET, CHICAGO.

MANUFACTURED BY NEW YORK & OHIO COMPANY, Warren, Ohio.

Shipments made from Chicago stock.

MASS. INSTITUTE OF TECHNOLOGY DEPARTMENT OF PHYSICS

## ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

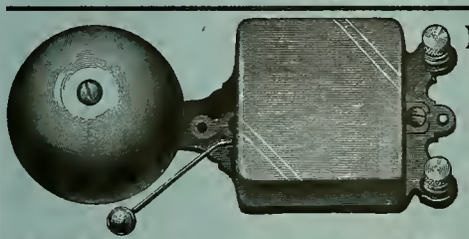
## DRY BATTERIES.

BEST OF ALL IS THE STANDARD,

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.

LIBERAL DISCOUNTS.



## BELLS,

BRONZE PUSH BUTTONS,
WINDOW AND DOOR SPRINGS,
FLOOR PUSHES,
SWITCHES.

Send for New Catalogue.

HUEBEL & MANGER, Manufacturers, 286-290 Graham Street, BROOKLYN, N. Y.

## TELEPHONES!!

This company is manufacturing

A Compound Magneto Telephone

which it sells outright under a guarantee both as to efficiency and as against infringement of patents.

It talks as well over one hundred miles as any other Telephone talks over one mile.

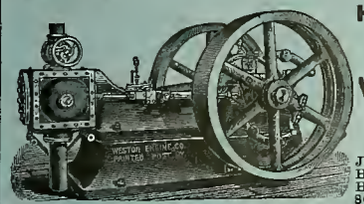
This company is also prepared to fully equip Telephone exchanges, (furnishing everything from the telephone to the wire and poles). Private lines, Factory plants, etc., and do all kinds of construction work.

Send for circulars and price lists.

WESTERN TELEPHONE CONSTRUCTION CO.,

539, 540 and 541 Monadnock Blk., Chicago, Ill.

## WESTON ENGINES.



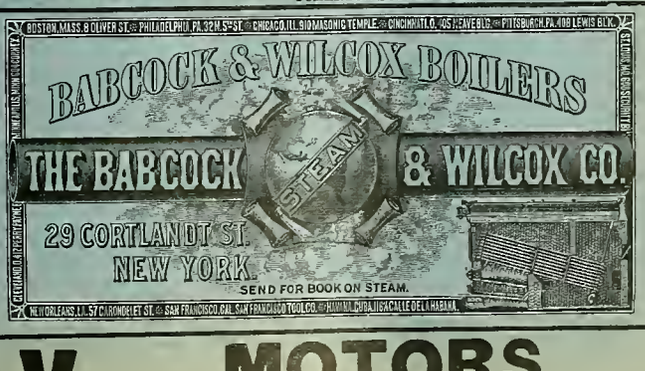
High Pressure Boilers.
Complete Power Plants.

Estimates and Drawings Submitted.

WESTON ENGINE CO., PAINTED POST, N. Y.

REPRESENTATIVES.

JULIAN SCHOLL & CO., 126 Liberty St., New York City.
HOFFMAN-RUSSELL CO., 82 Lake St., Chicago, Ill.
H. M. SCIPLE & CO., 3d and Arch Sts., Philadelphia, Pa.
SCRANTON SUPPLY & MACHINERY CO., Scranton, Pa.



## GENERATORS

*Belted or Direct Connected,*
*And of Any Capacity.*

## EDDY MOTORS

*From 1-2 H. P. Upwards.*

*All Apparatus Guaranteed as Represented.*

WINDSOR, CONN.

THE FIRST

# MUNICIPAL ELEVATED RAILWAY

IN THIS COUNTRY TO BE

## Operated Exclusively by Electricity

WILL BE THE

# CHICAGO WEST-SIDE ROAD.

IT WILL BE

## ENTIRELY EQUIPPED

WITH APPARATUS MANUFACTURED BY THE

# GENERAL ELECTRIC COMPANY,

THE ONLY RAILWAY APPARATUS WHICH HAS GIVEN

## PROOF OF ITS ABSOLUTE SUPERIORITY

BY ITS EFFICIENT AND SUCCESSFUL OPERATION OF THE

## INTRAMURAL ELECTRIC RAILWAY AT THE CHICAGO EXPOSITION.

## OUR ELECTRIC APPARATUS FOR STREET RAILWAYS

IS THE

## STANDARD APPARATUS OF THE WORLD.

# GENERAL ELECTRIC COMPANY,

MAIN OFFICE, SCHENECTADY, N. Y.

Boston, Mass., 180 Summer Street.
New York, N. Y., 44 Broad Street.
Syracuse, N. Y., 244 West Fayette Street.
Buffalo, N. Y., Erie County Savings Bank Building.

# THE LADY OR THE TIGER?

**Coal Bills versus First Cost**—Is it cheaper to buy the lowest in price and take your chances or to buy a **Good Wire** and be **Sure**—**is it?**

Which Central Stations pay the best dividends—those having equipment with price as the only consideration, or those in which quality is of first importance and price second?

**SIMPLEX WIRE** answers both these questions in favor of wise business judgment in the purchase of a **High Grade** of insulation. **It pays in the end.** Write for prices.

**Simplex T. Z. R. Weatherproof,** **Simplex Caoutchouc Wire.**

**SIMPLEX ELECTRICAL CO.,** WESTERN OFFICE, **1137-1138 Monadnock, Chicago.**

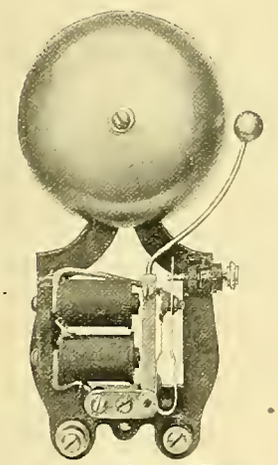
# One of the Beauties of Okonite

Is—well to tell the truth we are unable to discriminate. Okonite is possessed of so many rare qualities and is of such homogeneous merit that it would be a difficult task to point to this or that distinguishing feature and say, "herein is the chief virtue."

We doubt if there is, in the world, a man having any very intimate interest in Electrical Work who is not familiar with, if he has not actually used, Okonite Wire in some one of its many applications. There is but one way to account for such a precedence, for such universal appreciation—

**It never disappoints.**



This is the Contact Protected Dust-Proof Bell.

## Here is a Bell

That will meet the instant approval of every Contractor or Bell-fitter who has had to contend with the numerous difficulties in the way of assuring his customers uninterrupted service.

Nothing is more annoying than to be called a long distance just to chase a bug out of the contact-points, or to blow away a speck of dust. Various insect proof frames and boxes have been designed, but in each the really *vital* point was left unprotected. **In this bell** *the contact points are sealed.* No bug, no dust or other obstruction can prevent ringing. We have this bell in various sizes. Also a full line of House Goods Specialties, Annunciators, Batteries, Insulated Wires, Push Buttons and Construction Tools.

*Orders and correspondence given prompt attention.*

# BUILDING AND INSULATING PAPER

**Manufactured under U. S. PATENT No. 378,520.**

The validity of this Patent has been judicially established in the case of

## The Standard Paint Co. vs Henry J. Bird and James L. Reynolds,

Where, after an exhaustive litigation extending over four and a quarter years, and after consideration of a printed record of upwards of one thousand pages, the Circuit Court of the United States for the District of New Jersey, on July 5th, 1894, made and entered a decree adjudging that the Patent was valid and had been infringed by the defendants and directing an injunction against the defendants and an accounting.

The opinion of the Court written by Hon. George M. Dallas, Circuit Judge, holds that the Patent covers any Paper coated with a solid residuum obtained from the distillation of Petroleum and that the manufacture and sale of any substantially similar paper is an **INFRINGEMENT** of the Patent.

The coating mentioned, and which, as established by the evidence in the case and by decree of the Court, was first used by this Company and protected by the U. S. Patent referred to, makes an *Odorless, Water, Acid and Alkali Proof*, and thoroughly *Insulating Paper*, as is well-known.

The Court holds that Papers possessing these essential characteristics, which were new up to the time of their introduction under the name of *P. & B.*, made by others, a violation and infringement of our rights.

We beg to caution the public against the purchase of such infringing papers, as we shall enforce our rights in every instance.

Our prices remain the same as heretofore, and *the best paper*, the *P. & B.*, can be had from us, on short notice, and in any quantities.

## W. U. Double Petticoat Teat Insulator.

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

THE

# "CLARK" WIRE.

TRADE MARK.

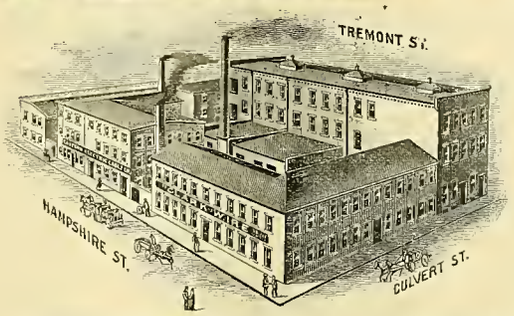
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**

**GREAT WESTERN MFG. CO.,**

**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## TENDERS

—FOR—

## Electric Light Plant.

Tenders will be received by registered post only, addressed to Ald. W. T. Stewart, Chairman Committee on Fire and Light, Toronto, up to 11 o'clock A. M. of

**Saturday, the 1st of September, 1894,**

For the installation of a complete electric light plant for the

**CITY OF TORONTO, ONT.**

Separate tenders will be received for the various portions of the work, viz.:

1. Engine Equipment.
2. Counter Shaft and Pulleys.
3. Belting.
4. Boilers.
5. Pumps and Steam Piping.
6. Economizers.
7. Dynamos and Station, Electrical Apparatus.
8. Arc Lamps.
9. Poles and Overhead Circuits.
10. Mast Arms and Lamp Attachments.

Plans and specifications may be seen and forms of tender obtained at the office of the City Engineer on and after Saturday, the 11th of August, 1894.

Specifications for items Nos. 2, 3, 5, and 6 may be withheld until balance of apparatus is decided upon.

A Deposit, in the form of a marked check, payable to the order of the City Treasurer, for the sum of 2½ per cent. on the value of the work tendered for, must accompany each and every tender, otherwise they will not be entertained. All tenders must bear the *bona fide* signatures of the contractor and his sureties (see specifications) or they will be ruled out as informal.

The Committee do not bind themselves to accept the lowest or any tender.

W. T. STEWART.
Chairman Committee on Fire and Light.
Committee Room, Toronto, July 26th, 1894.

## TENDERS

**For Lighting the Streets of the City of Toronto.**

Tenders addressed to the undersigned will be received by registered post up to 12 o'clock noon of

**SATURDAY, SEPTEMBER 1st, 1894,**

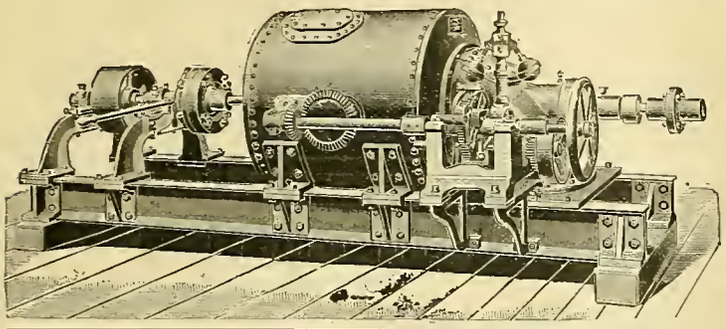
For the lighting of the streets, avenues, squares, and lanes of the City of Toronto with electric light and gas for a period of five years from the 1st of January, 1896. Specifications and forms of tender can be obtained upon application at the office of the Secretary of the Fire Department, Bay street, Fire Hall, on and after Wednesday, August 1st.

Cash deposit or marked check, made payable to the order of the City Treasurer for the sum of $3,000, must accompany each and every tender, together with the *bona fide* signatures of two responsible persons who will become sureties for the due fulfilment of the contract. The deposit accompanying the tender will be forfeited to the city in the event of the person or persons, whose tender is accepted, failing to execute the contract or give satisfactory sureties for the due fulfillment of the same. Deposite of unsuccessful tenderers will be returned

Lowest or any tender not necessarily accepted.

W. T. STEWART.
Chairman Committee on Fire and Light,
City Clerk's Office, Toronto, July 27th, 1894.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition**, giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS**, to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

### PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Coostruction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

### PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

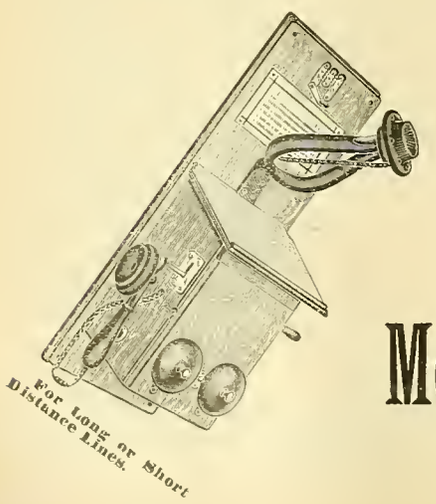
We are now prepared to sell outright Telephones, Magneto Transmitters, Magneto Bells, Telephone Switchboards and Apparatus.

The Gilliland Telephone Company is incorporated and thoroughly organized for the further purpose of constructing Telephone Exchange plants, building private lines, or equipping Hotels, Factories, Resident Apartments or Department Stores with a complete Telephone speaking tube system. Our Telephone set consists of Magneto Call Bell, Desk and Back-board, Hand Receiver with Cord and Bi-Polar Magneto Transmitter, neatly and compactly put together in a style familiar to the public, and our aim has been to supply a Telephone which will give satisfaction both electrically and mechanically. In principle of construction, those features are embodied which experience in Telephone service demonstrate to be the most efficient and reliable. Complicated mechanism has given place to simplicity of construction, and our Telephone set as it stands to-day is without doubt the best instrument yet offered to the public. Telephone experts who have made careful and thorough tests verify this statement and unhesitatingly pronounce our Telephone absolutely first-class.

We employ men of experience and ability for the purpose of Telephone Exchange construction and electrical work, and are prepared to furnish estimates promptly, or contract for electrical work at once. Correspondence solicited.

GILLILAND TELEPHONE COMPANY.



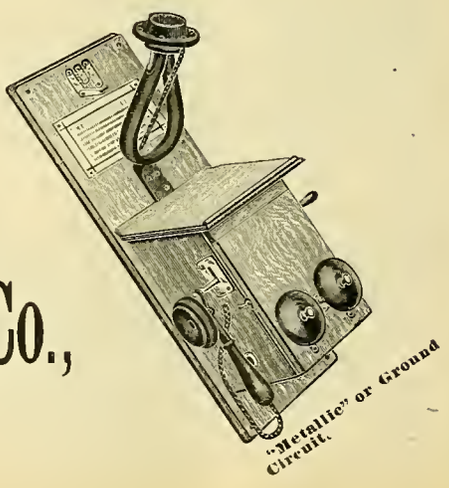
For Long or Short Distance Lines.

Write for Agency,
CITY, COUNTY AND STATE RIGHTS.

Selling Agents:

# Metropolitan Electric Co.,

186 and 188 Fifth Ave., Chicago.



"Metallic" or Ground Circuit.

# A NEW WORK.

## THE TELEPHONE HAND-BOOK.

By HERBERT LAWS WEBB.

**About 175 Pages.** **Profusely Illustrated.**

Price, postage free, $1.00.

ELECTRICIAN PUBLISHING COMPANY,

6 LAKESIDE BUILDING, CHICAGO.

# READY SEPT. 1st.

Uniform in size and style with the other works of our famous Hand-Book series, of which 40,000 copies have been sold to date. Practical subjects treated in plain language by practical men.

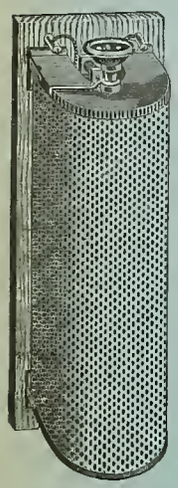
# A TIMELY BOOK.

# JOHN A. ROEBLING'S SONS CO.,

Insulated Wire of All Kinds,

**TRENTON, N. J.**

**CHICAGO, 173 Lake St. SAN FRANCISCO, 25-27 Tremont St. NEW YORK, 117 Liberty St.**



Please mention the WESTERN ELECTRICIAN.

## MEISSNER'S

Rheostat and Stage Dimmer,

INCOMBUSTIBLE, DURABLE, COMPACT AND REASONABLE IN PRICE.

**IMPROVED FOCUSING LAMP,**

For continuous and Alternating currents, Photo-engraving and Theatrical use.

Motor Starting Cylinders, Special Resistance Devices of All Kinds. Annunciators, Switches, Etc.

For illustrated descriptive catalogue of latest Electrical Specialties, write to

**Washington Electric Company,**

205 and 207 S. Canal St., Chicago.

BOLGIANO'S

**Electric Fan Water Motor.**

Current free as it connects with any faucet. Sample $6.00. Wholesale and retail.

The Bolgiano Mfg. Co., 415 Water St., BALTIMORE, MD.

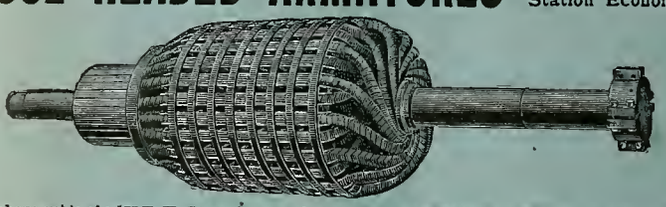
**Storage Batteries**

FOR ALL PURPOSES.

Bradbury-Stone Electric Storage Co., LOWELL, MASS.

## COOL HEADED ARMATURES

Are Necessary for All-around Station Economy.



The above cut is of a 175 K. W. Generator wound on our new open-head spiral system. All coils alike, perfect balance, handsome appearance. Write for prices on **HEAVY CENTRAL STATION REPAIRS**; *Large Commutators*, Search Lamps and Station Dynamos.

Shops, Jersey City, N.J. **S. W. RUSHMORE,** 126 Liberty St., NEW YORK.

**CONTRACTORS FOR COMPLETE SUBWAY SYSTEMS FOR ELECTRIC RAILWAYS AND ELECTRIC LIGHT, TELEPHONE AND TELEGRAPH COMPANIES.**

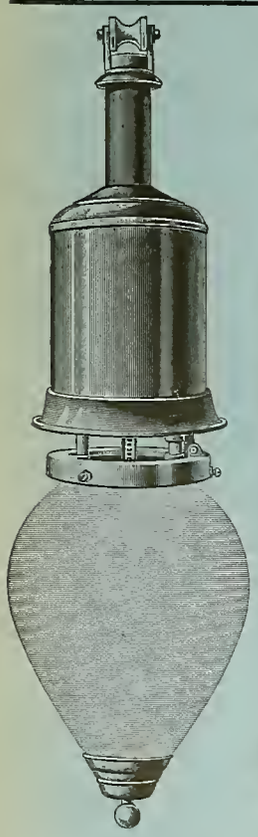
**EDWARD S. PEROT, President.**
**C. GALLAGHER, Vice-Pres. & Gen. Mgr.**
**JAS. P. McQUAIDE, Sec. & Treas.**

## THE NATIONAL CONDUIT MANUFACTURING CO.,

**MANUFACTURERS OF WROUGHT-IRON CEMENT-LINED TUBES FOR ELECTRIC SUBWAYS.**

**Works, HASTINGS-ON-HUDSON.** **New York Office, TIMES BUILDING.**

We own Patent No. 395,584, covering Wrought-Iron Cement-Lined Pipe for Subways and the method of Laying. Also, Patents Nos. 416,234 and 416,235 for Distributing Boxes. Over 9,000,000 feet of this Subway Constructed by us *now in use in the United States and Canada.*



## STANDARD "WARD" ARC LAMPS.

You have seen our special offer on 1,000 "Ward" lamps, direct current. Well, the sale is fairly under way. If you desire anything in this line, let us hear from you quickly. State full particulars and quantity that you wish figures on.

## Electric Construction & Supply Co.,

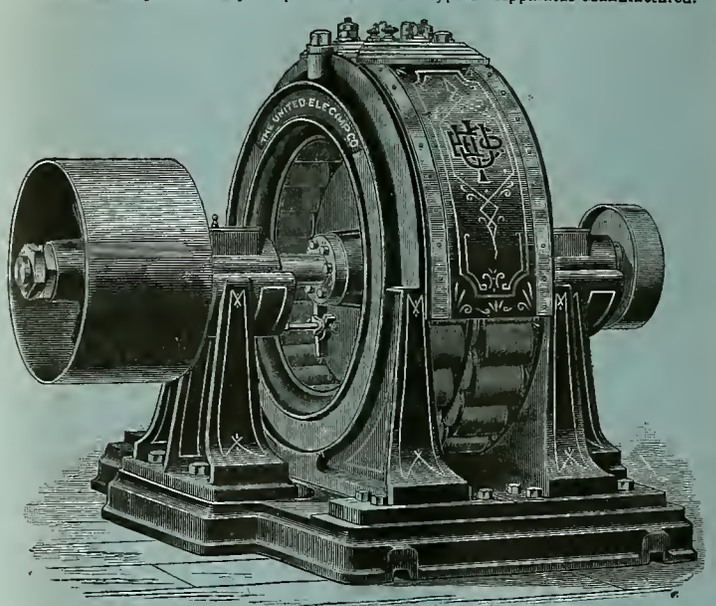
Telephone Building, New York. Established 1881. Unity Building, Chicago.

## Alternating Current Generators,

**For Central Station Equipment.**

Adapted for Arc and Incandescent Lighting.

Guaranteed Equal in Every Respect to any other Type of Apparatus Manufactured.



Slow Speed and Close Regulation. Standard of Simplicity and Durability.

**ALSO**

Direct Current Apparatus for Lighting Factories, Public Buildings and Isolated Plants.

Improved Long Distance Series Incandescent Apparatus for Street and Commercial Illumination.

Incandescent Lamps and Sockets for use on Arc Light Circuits.

**Correspondence Solicited.**

**THE UNITED ELECTRIC IMPROVEMENT CO.,**

**Drexel Building, Philadelphia, Pa.**

# Western Electrician

$3 per Annum. Copyright, 1894, by Electrician Publishing Company, Chicago. EVERY SATURDAY. Entered at Chicago Postoffice as mail matter of the second class. 10 cents per Copy.

Vol. XV. CHICAGO, AUGUST 25, 1894. No. 8

## Chicago Insulated Wire COMPANY,

Manufacturers of Insulated Electric Wires & Cables.

414 and 416 NORTHERN BLDG.,

Corner Lake and La Salle Sts.,

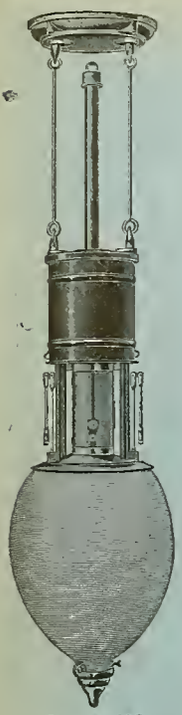
THE EDDY ELECTRIC MFG. CO., WINDSOR, CONN.



Thomson '93 Standard Alternating Circuit Arc Lamp.

# THE THOMSON '93 ARC LAMP

FOR

## DIRECT, ALTERNATING, POWER AND RAILWAY CIRCUITS.

Thomson '93 Ornamental Arc Lamp.

WRITE FOR OUR CATALOGUE.

COMBINES THE FOLLOWING ADVANTAGES NOT FOUND IN ANY OTHER LAMP:

**EASE OF CARBONING.**
Motion of carbon rod entirely free. No loss of time in changing. No waste of carbon life.

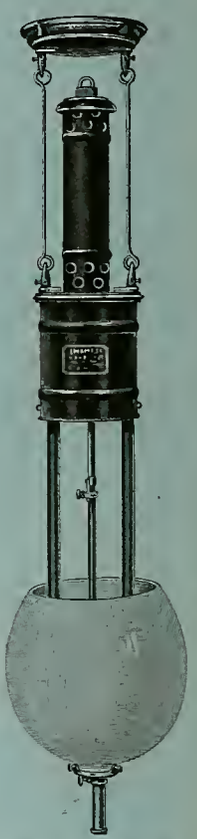
**FEWNESS OF PARTS.**
Parts interchangeable with all lamps, except the alternating current lamp.

**STEADY BURNING—NO HISSING.**

**PERFECT REGULATION.**
Regulation and feeding point independent of weight of carbon.

**SIMPLICITY AND SENSITIVENESS OF FEED MECHANISM.**
Neither clutch nor gear, but combines advantages of both. No troublesome escapement.

**EASE OF INSTALLATION AND ADJUSTMENT.**
Labor reduced to a minimum.



Thomson '93 Standard Lamp for Incandescent or Railway Circuits.

# THE LADY OR THE TIGER?

**Coal Bills versus First Cost**—Is it cheaper to buy the lowest in price and take your chances or to buy a **Good Wire** and be **Sure**—**is it?**

**Which Central Stations pay the best dividends—those having equipment with price as the only consideration, or those in which quality is of first importance and price second?**

**SIMPLEX WIRE** answers both these questions in favor of wise business judgment in the purchase of a **High Grade** of insulation. **It pays in the end.** Write for prices.

**Simplex T. Z. R. Weatherproof,** **Simplex Caoutchouc Wire.**

## SIMPLEX ELECTRICAL CO., WESTERN OFFICE, 1137-1138 Monadnock, Chicago.

# INCANDESCENT LAMPS!

## REDUCTION IN PRICES.

8, 10 and 16 Candle Power Lamps, 22 Cents. 20 and 25 Candle Power Lamps, 27 cents.
32 Candle Power Lamps, 33 Cents.
WITH DISCOUNTS VARYING ACCORDING TO QUANTITIES ORDERED.

Our Stopper Incandescent Lamps, which we offer at the above low prices, have the following advantages:

**1st. They are efficient and have long life.**
**2nd. The normal candle power is kept constant by means of a material inclosed within the bulb.**
**3rd. All lamps have uniform molded glass bases, and can be used in the following sockets: Edison, Brush-Swan, United States, Thomson-Houston and Sawyer-Man.**
**4th. Our lamp in our new socket excels all others in appearance.**

The above low prices have been brought about by the use of special machinery and through improvements perfected by a constant application to the methods of manufacture of every detail of the lamp, including the manufacture of the glass.

ADAPTERS Are furnished at five cents each, by the use of which all the well-known sockets may be easily fitted to receive our lamps.

DEALERS Should buy and use Stopper Lamps only. Heretofore, in consequence of the variety of sockets in use, dealers have been obliged to carry a large stock of lamps with the corresponding bases attached. By the use of our Stopper Lamps and Adapters, the stock of lamps required for the trade will, therefore, be greatly reduced.

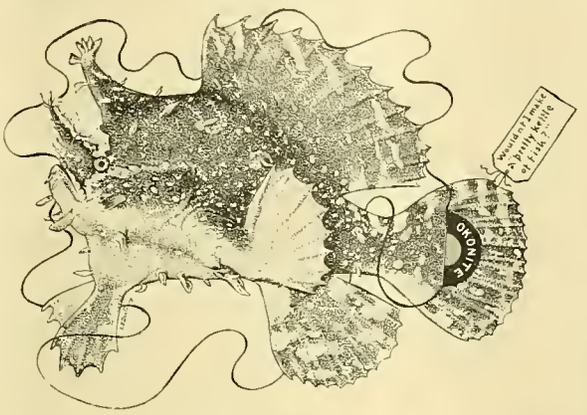
no matter what sort of

## Queer Fish

you tangle up with Okonite wire, it never loses its identity. There are certain distinguishing marks, certain inherent qualities of insulation which make it conspicuous wherever used.

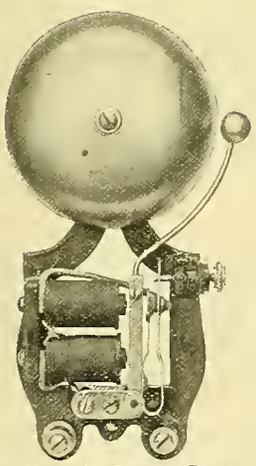


There have been cases where the workmen, with an abiding faith in Okonite, mixed a little of it with a great deal of other, and inferior, insulation, hoping with that little to save the whole installation from the wrath of the inspector. While it is no doubt true that Okonite would cover a multitude of sins in this manner, *we do not approve of the method.*

Let every fish wiggle its own fins.

**What we want is orders** for the simon pure, unadulterated **Okonite.**

---



**This is the Contact Protected Dust-Proof Bell.**

## Here is a Bell

That will meet the instant approval of every Contractor or Bell-fitter who has had to contend with the numerous difficulties in the way of assuring his customers uninterrupted service.

Nothing is more annoying than to be called a long distance just to chase a bug out of the contact-points, or to blow away a speck of dust. Various insect-proof frames and boxes have been designed, but in each the really *vital* point was left unprotected. **In this bell** *the contact points are sealed.* No bug, no dust or other obstruction can prevent ringing. We have this bell in various sizes. Also a full line of House Goods Specialties, Annunciators, Batteries, Insulated Wires, Push Buttons and Construction Tools.

*Orders and correspondence given prompt attention.*

# HAVE YOU INVESTIGATED

**The merits of the Stanley Two-Phase System of Alternating Current Apparatus?**

**It will pay you to do so, as its earning capacity is much greater than anything else on the market.**

Light and Power can be supplied by this system from the same generator and circuit.

## THE GENERATOR

**Is superior to all others in efficiency, simplicity, durability and inherent regulation.**

## THE MOTORS

**Are self starting, take current in proportion to their load, substantially as direct current motors do, and are more simple, durable and convenient to use than direct current motors.**

## THE STANLEY TRANSFORMERS

**Excel all others in efficiency, regulation, convenience, safety and durability. We insure them for a term of years at a small premium.**

# A GREAT REDUCTION IN PRICES ON OUR

# REFLECTOR PLATE ALTERNATING LAMP.

## We are Heavily Stocked with New Styles and Designs.

We claim for our lamp a better distribution of light than can be obtained from any other alternating lamp. We obtain this result by means of our reflector plate.

The only lamp that has a legal right to use a reflector plate. We guarantee 50 per cent. more effective light than can be obtained from any other alternating lamp.

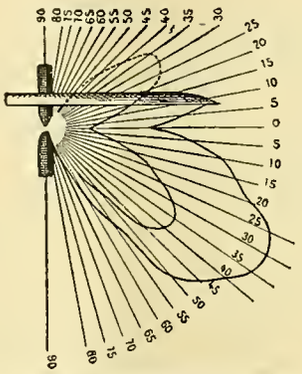

Diagram showing distribution of light with and without a reflector plate.

Our phenomenal sales are due to the reflector plate.

No alternating lamp can be a success without it.

We obtain more economy from our lamp than can be obtained from any other alternating lamp in the market. We do this by means of the

## SPENCER ECONOMY COIL.

The only Coil that allows the lamp to burn at its most economical voltage (28 volts), which is accomplished by means of its starting device.

The only adjustable **Economy Coil** in the market. It requires no resistance nor additional switch.

THE

# "CLARK" WIRE.

TRADE MARK.

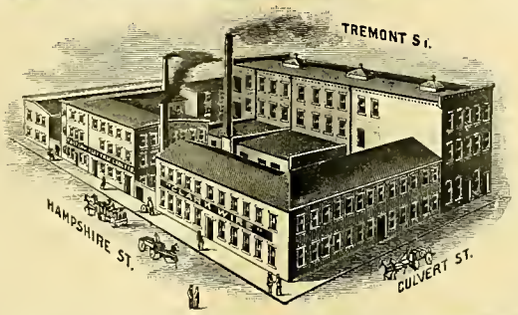
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**

**GREAT WESTERN MFG. CO.,**

**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

Direct Current, Slow Speed, Iron Clad,

In Sizes up to 30 Kilowatts.

Lundell Dynamos directly connected to any type of high speed engines.

For Lundell Dynamo and Motor catalogues, prices, etc., address the

**Interior Conduit & Insulation Co.**
44 Broad St., N. Y.

## WANTED.

First class engineer with best experience as chief and erecting engineer on triple expansion Corliss and high speed engines, thoroughly up in indicator and economical management, will be open for engagement after Sept. 1. Best references Address, E. E. Clock, Withee, Wis.

## THE D'UNGER TELEPHONE.

**The Peer of All,**
**The "Far-Away Talker."**

*Beware of Infringing or of Using Infringing Instruments.*

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* self-cleaning speech sender in the world; the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager,
Palmer House, Chicago, Ill.

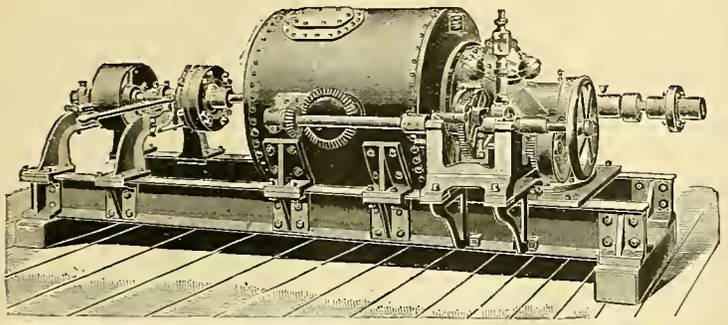
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and gr at efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

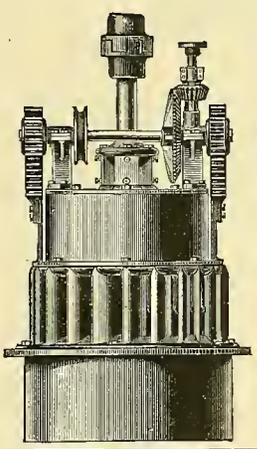
**JOS. DIXON CRUCIBLE CO., Jersey City, N. J.**

---



## THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

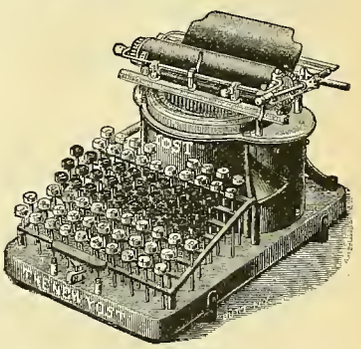
Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

---

## The New Yost 1894 Model.



Constructed on principles radically its own, insuring results always sought for but absolutely unattainable in the construction of any other machine. It is pre-eminently the telegrapher's and professional stenographer's typewriter.

Let us send you catalogue.

### PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

### PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

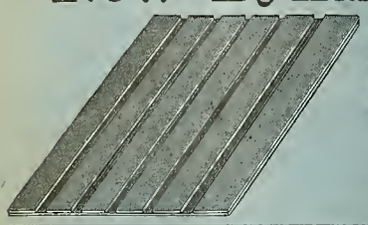
Monadnock Building, Chicago. THE BUCKEYE ELECTRIC CO., Cleveland, O.

**TO FIT ANY STANDARD SOCKET.**

Judge Ricks' decision against the Edison Company and in our favor, frees these lamps from any taint of infringement. Order no other.

## New Dynamo Belting.



Patent Grooved Belting having Grooves running lengthwise of the Belt, serve as channels to permit the escape of air between Belt and Pulleys, to such a degree that the air cushion is overcome and the Belt can be run very slack, thereby taking the heavy strain from the bearings.

SCHULTZ BELTING CO., St. Louis, Mo.
Agents in all Principal Cities.
BRANCHES:
164 Summer Street, Boston.
225 Pearl Street, New York.
129 North 3d Street, Philadelphia.

BOLGIANO'S
**Electric Fan Water Motor.**
Current free as it connects with any faucet.
Sample $6.00. Wholesale and retail.

Thomson '93 Standard Alternating Circuit Arc Lamp.

# THE THOMSON '93 ARC LAMP

FOR

## DIRECT, ALTERNATING, POWER AND RAILWAY CIRCUITS.

Thomson '93 Ornamental Arc Lamp.

WRITE FOR OUR CATALOGUE.

COMBINES THE FOLLOWING ADVANTAGES NOT FOUND IN ANY OTHER LAMP:

**EASE OF CARBONING.**
Motion of carbon rod entirely free. No loss of time in changing. No waste of carbon life.

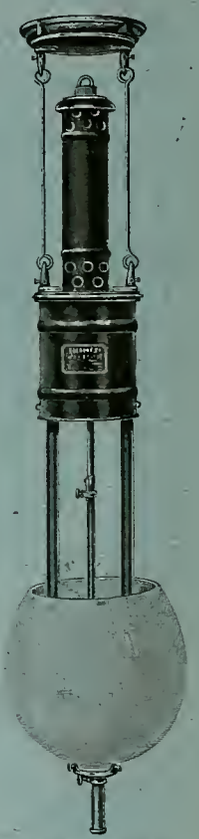
**FEWNESS OF PARTS.**
Parts interchangeable with all lamps, except the alternating current lamp.

**STEADY BURNING—NO HISSING.**

**PERFECT REGULATION.**
Regulation and feeding point independent of weight of carbon.

**SIMPLICITY AND SENSITIVENESS OF FEED MECHANISM.**
Neither clutch nor gear, but combines advantages of both. No troublesome escapement.

**EASE OF INSTALLATION AND ADJUSTMENT.**
Labor reduced to a minimum.



Thomson '93 Standard Lamp for Incandescent or Railway Circuits.

# DO NOT MAKE A MISTAKE

And think that the wire lowest in price is as good and will give as good service as that of a recognized high quality. In these days of sharp competition, price is a good indication of quality, but you cannot buy gold dollars below par. Neither can you buy the best wire on the market as low as the poorest, but you can buy it at very little difference—such a slight one that it does not begin to indicate the difference in quality.

***Simplex T. Z. R. Weatherproof Wire is the Standard of High Insulation.***

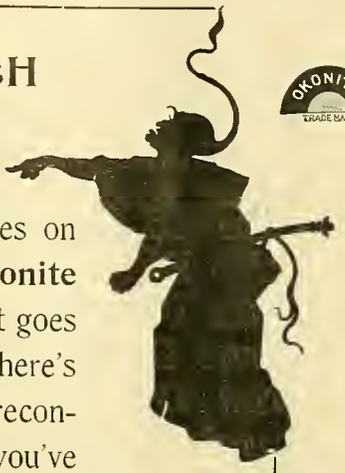
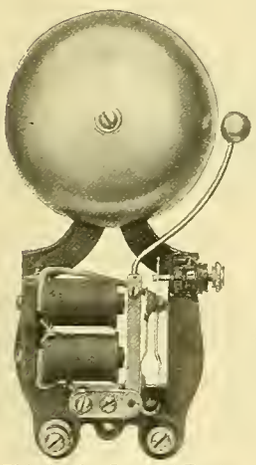
## iT woulD astonisH



most anybody to have the cold, black figures pointed out showing the great quantity—the miles on miles—the tons on tons of **Okonite** that are reeled off every year. It goes everywhere—and stays there—there's no necessity for tearing out, reconstructing, and so forth, *after* you've put in Okonite. Many times it must be done before. We don't believe that you want to risk your reputation as an engineer, nor the success of the installation, by chancing something inferior.

*We know we are right.*

## Here is a Bell



This is the Contact Protected Dust-Proof Bell.

That will meet the instant approval of every Contractor or Bell-fitter who has had to contend with the numerous difficulties in the way of assuring his customers uninterrupted service.

Nothing is more annoying than to be called a long distance just to chase a bug out of the contact-points, or to blow away a speck of dust. Various insect-proof frames and boxes have been designed, but in each the really *vital* point was left unprotected. **In this bell** *the contact points are sealed.* No bug, no dust or other obstruction can prevent ringing. We have this bell in various sizes. Also a full line of House Goods Specialties, Annunciators, Batteries, Insulated Wires, Push Buttons and Construction Tools.

*Orders and correspondence given prompt attention.*

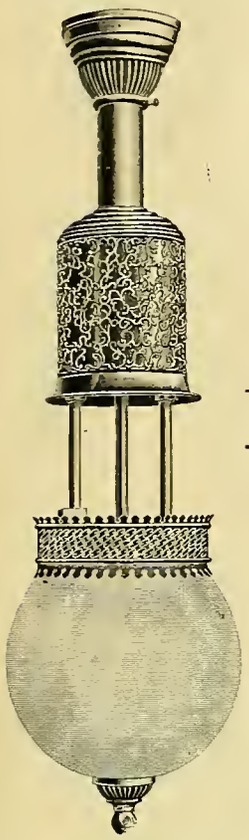
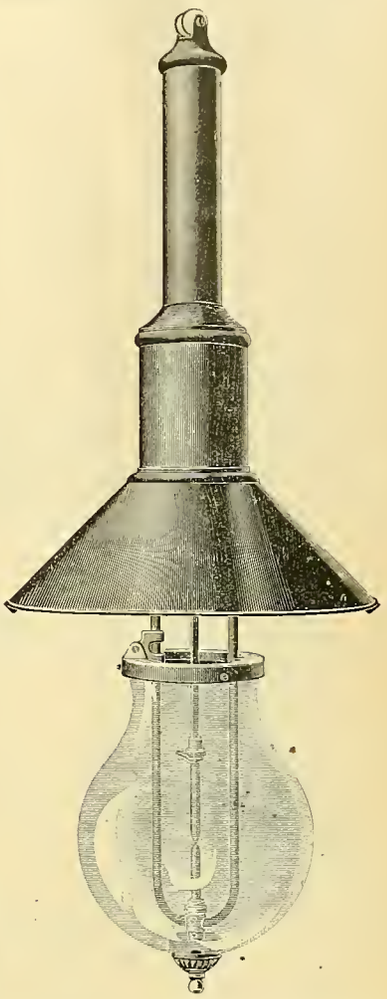
# THE BEST LAMP ON EARTH.



For Direct Current.
For Street Railway Circuits.
For Alternating Circuits.
For Series Arc Circuits.



## NEW AND SUPERIOR.

These lamps are far better than anything manufactured in the line of arc lamps—stronger, simpler, more durable and easier to maintain. They are ALL weatherproof. A trial will convince you of their merits.

**These lamps, both "Twin" and Single, after an exhaustive competitive test, were adopted for use in Brooklyn for low tension street lighting and are now in successful operation.**

We manufacture all kinds of focusing lamps, search lamps, theatrical lamps, stereopticon lamps, and special lamps of any description. In short, if you want ***anything*** in the line of arc lamps, write us before purchasing elsewhere.

We are prepared to furnish promptly ornamental lamps of handsome design, for either direct or alternating current, finished to suit the customer.

—— MANUFACTURERS OF ——

# DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

**HIGH-SPEED BELTED SIEMENS DYNAMOS**
Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

**ALTERNATING AND MULTIPHASE CURRENT DYNAMOS**
With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

**MOTORS**
Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H. P. Durable and economical in operation.

**SIEMENS BAND LAMPS**
For direct and alternating current, for constant potential and series machines.

**SIEMENS ARC LIGHT CARBONS**
With either solid or soft cores, which are the most economical in the world and give a steady light.

**ALL INSTRUMENTS**
Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

### IMPERIAL DRY BATTERY.

Guaranteed the best Dry Battery ever made. Interoeal short circuiting or local action is elimicated. Will not deteriorate when not doing work. Will hold its first value over long periods of time Iooeroal resistance small; high and constant, E. M. F. Will not run down or die on the shelf. No bureting of eeals or oozing of salts from the top.

### Burnley Cartridge Battery.

Cartridge or Porous Cups made of especially prepared paper. One-half the size and one-third the weight of other porous cups. Guaranteed to be equal to any Salammoniac battery made. The cheapest battery now on the market.

A'l Batteries Guaranteed. Send for Catalogue.

THE

# "CLARK" WIRE.

TRADE MARK.

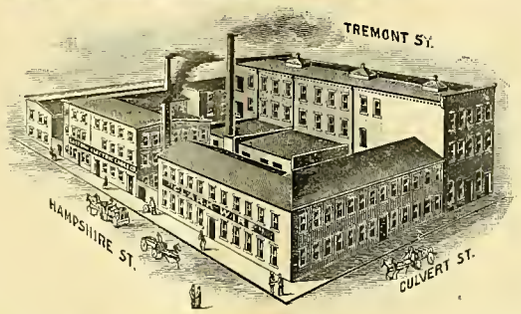
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalognes with Terms and Discounts for Quantities.

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C., August 25, 1894.

Sealed proposals (in duplicate) will be received at the Department of the Interior until 3 o'clock p. m. Monday, September 24, 1894, for the construction of a Telephone Exchange System for the Department of the Interior and at the same time and place proposals will also be received for the extension and modification of the present Telephone System of the Interior Department. Bids must be made on Government blanks. Blank forms of proposal, specifications, etc., may be obtained on application at the office of the Chief Clerk of the Department, where drawings showing details may also be inspected. All proposals received will be opened at the time and place above stated, and bidders are invited to be present at such opening.

JNO. M REYNOLDS, Acting Secretary.

## SEALED PROPOSALS

Will be received by the City of Jackson, Tenn., until 12 o'clock noon, October 2, 1894, for furnishing, operating and maintaining forty double arc 2,000 candle power electric lamps on the streets of said city, with the privilege of 50 at the same price per light, for a term of five years. An exclusive franchise will also be granted for all arc and incandescent lighting for both commercial and domestic use for a term of five years. For specifications, etc., apply to

SAM C. LANCASTER,
City Engineer.

## WANTED.

Position as chief engineer, or as superintendent in electric light plant, or combined electric light and water works, in town of from 4,000 to 15,000 population. Wages reasonable. Al references. Central States preferred.

Address **J. S. BRISTOL,**
215 William Street, BAY CITY, MICH.

---

## WANTED.

Position wanted as superintendent or electrician of electric light plant. Have had technical training and five years' experience in construction and station work. Good references. Address "AMERICAN,"
P.O. Box 545, Kenosha, Wis.

---

## WANTED.

We will pay 15c each for clean copies of the WESTERN ELECTRICIAN dated:

August 26, 1893, Vol. xiii, No. 9.
October 7, 1893, Vol. xiii, No. 15.
November 4, 1893, Vol xiii, No. 19.
May 26 1894, Vol. xiv, No. 21.
May 19, 1894, Vol. xiv, No. 20.
January 13, 1894, Vol. xiv, No. 2.
February 10, 1894, Vol. xiv, No. 6.
March 10, 1894, Vol. xiv, No. 10.
April 7, 1894, Vol. xiv, No. 14.

**WESTERN ELECTRICIAN,**
6 Lakeside Building, Chicago.

---

## THE D'UNGER TELEPHONE.

**The Peer of All.**
**The "Far-Away Talker."**

*Beware of Infringing or of Using Infringing Instruments.*

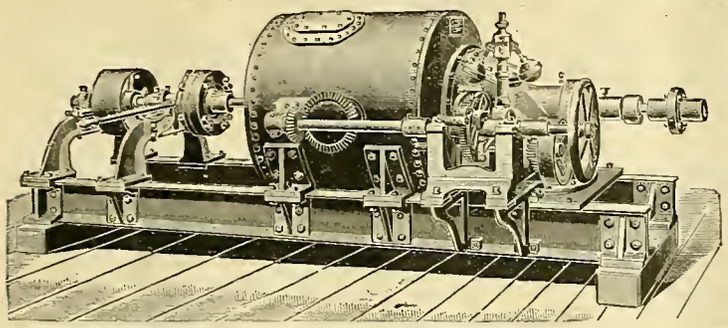
The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* self-cleaning speech sender in the world; the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telepone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager,
Palmer House, Chicago, Ill.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

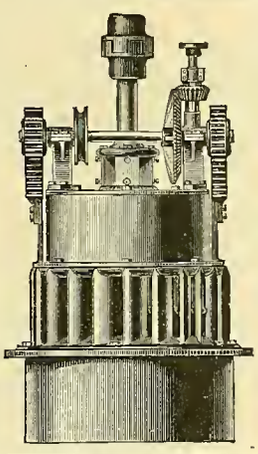
## GRAPHITE SPECIALTIES

**FOR ELECTRICAL USES.**

**Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.**

**JOS. DIXON CRUCIBLE CO., Jersey City, N. J.**

---



## THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

# ELECTRICITY FOR ENGINEERS.

## Part I, 268 Pages, $2.00. Part II, 156 Pages, $1.00.

**WHEN ORDERED TOGETHER PRICE IS $2.50.**

*Both Works Profusely Illustrated.*

☛Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

### PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators—Brushes—Different Styles of Brushes—Double Brushes—Single Brushes—Troubles with Commutators and Brushes—Correct Position of Brushes—Sparking at Brushes—Care of Brushes and Commutators—Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation—Dynamo—Extra Brush—Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

### PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation—Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

# PERFECT AND LONG-LASTING INSULATION

Assured by the Use of

**SIMPLEX T. Z. R. WIRE** *FOR LINE WORK.*

**SIMPLEX BRAIDED CAOUTCHOUC** *FOR INSIDE WIRING.*

**SIMPLEX MINING WIRE** *FOR MINES AND EXTREMELY DAMP PLACES.*

**SIMPLEX LEAD COVERED AND ARMORED CABLES**
*FOR UNDERGROUND AND SUBMARINE WORK.*

**SIMPLEX INSULATING PAINT,** *NOT THE CHEAPEST, BUT THE BEST.*

**SIMPLEX ELECTRICAL CO.,** Western Office, 1137-1138 Monadnock, Chicago.

# HAVE YOU INVESTIGATED

The merits of the Stanley Two-Phase System of Alternating Current Apparatus?

It will pay you to do so, as its earning capacity is much greater than anything else on the market.

Light and Power can be supplied by this system from the same generator and circuit.

## THE GENERATOR

Is superior to all others in efficiency, simplicity, durability and inherent regulation.

## THE MOTORS

Are self starting, take current in proportion to their load, substantially as direct current motors do, and are more simple, durable and convenient to use than direct current motors.

## THE STANLEY TRANSFORMERS

Excel all others in efficiency, regulation, convenience, safety and durability. We insure them for a term of years at a small premium.

**The Best Appointed and Largest Electrical Supply House in the World.**

WE HAVE purchased the entire stock of **Electrical House Goods** manufactured by the **DETROIT ELECTRICAL WORKS.**
(They having decided to discontinue the business).

The line of HOUSE GOODS made by this well known concern has, for years, been recognized by consumers and the trade as standard.

The goods which we have bought are all fresh, new and perfect (there is not a defective or shopworn piece in the whole lot), they are of the very latest design and embody the best that has been accomplished in recent improvements.

The entire stock is now in our Chicago store, arranged on our shelves, and listed at prices that should move it out as rapidly as we can ship.

We bought at very low figures, and will divide the honors with our customers.

## Annunciators.

Elevator style, 2 ind. and up. House style, single column, 2 to 6 ind. House style, double column, 4 to 15 ind. Burglar Alarm, 3 to 8 ind. Burglar Alarm, with clock, 12 indications.

Annunciators finished in Oak, Walnut, Cherry.

**Bells**—Wood Box, Iron Box, Skeleton, 2½ to 12 inch gongs.

## Push Buttons

In an endless variety of metal and wood finishes.

Pear Shape. Multiple Pushes. Floor and Table Pushes. Gas Lighting. Hard Rubber Midget Pushes. Private Line Cut-outs. Pole Changer Switches. Cotton and Silk Double and Single Tinsel Cord, in red and green.

Also a great variety of miscellaneous supplies, which you will find listed in our special circular quoting prices. If you have not received one of these, send your address at once, as the prices apply only to this Detroit stock, and so long only as it lasts.

# CHLORIDE WINS!

## INJUNCTION REFUSED.

Judge Green, of the United States Circuit Court, District of New Jersey, on August 27th denied the motion for injunction asked for by the Consolidated Electric Storage Company et al versus the Electric Storage Battery Company. The Electric Storage Battery Company calls attention to the following testimonials which have recently been given to the Chloride Accumulator:

***Professor Chandler, of Columbia College, says:***

"The Chloride Storage Battery is likely to realize all our expectations. Its good qualities include the whole list of qualities that a storage battery can manifest."

***The following is from Professor Barker, of the University of Pennsylvania:***

"I would say that in my judgment this battery has great merit. Among its chief points of excellence, I may mention, first, its high efficiency and large storage capacity; second, its eminent adaptability to commercial needs. I am satisfied that it more nearly fulfills the requirements of modern electric practice than any other storage battery within my knowledge."

***Professor Charles L. Hastings, of Sheffield Scientific School of Yale University, says:***

"The Chloride Accumulator was selected only after careful inquiry concerning all available types. Thus far it has met all our expectations, and promises to fully justify our choice."

***The following is from Mr. A. E. Kennelly:***

"I consider that the principles embodied in its construction make it superior to any storage battery that has yet been placed upon the market in this country."

***Professor Hugh L. Callender, of McGill University, Montreal, says:***

"I have tested the small Chloride Accumulator, type E 5, with results which confirm very nearly the makers' claims with regard to capacity and efficiency. The ampere efficiency of the cell comes out 96.1 per cent.; the watt efficiency, 84 per cent."

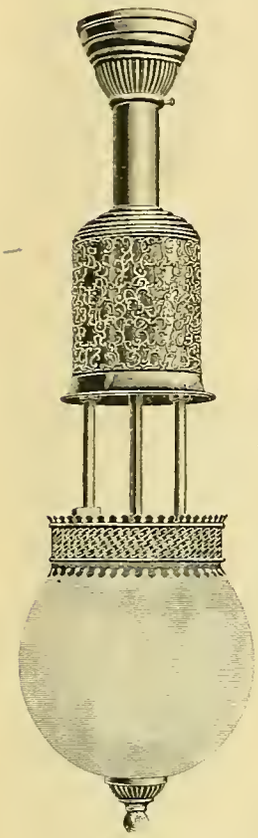
***The following is from letter received from W. K. L. Dickson, of the laboratory of Thomas A. Edison:***

"Your Chloride Accumulator stands unique among its competitors, marking an important stride in the right direction, and being capable of application to varied uses."

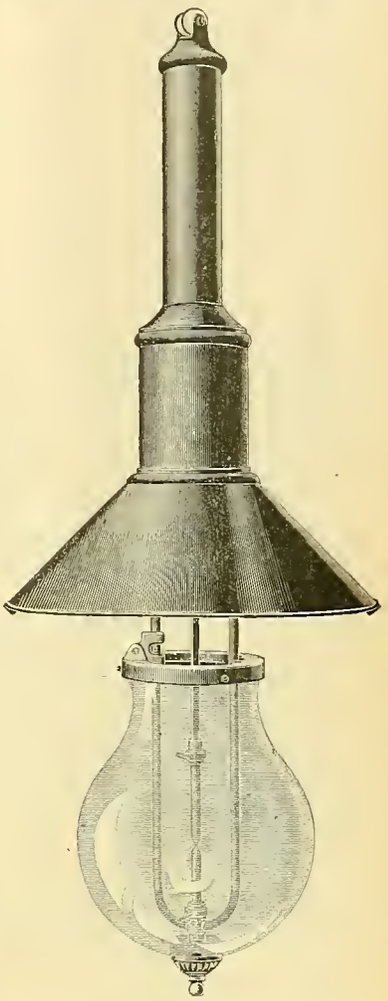
***Professor Houston says:***

"The construction of your Battery involves principles so radically different from that of other prior storage batteries as to cause its invention, in my judgment, to mark an era in the history of the art."

# THE BEST LAMP ON EARTH.



For Direct Current.
For Street Railway Circuits.
For Alternating Circuits.
For Series Arc Circuits.



## NEW AND SUPERIOR.

These lamps are far better than anything manufactured in the line of arc lamps—stronger, simpler, more durable and easier to maintain. They are ALL weatherproof. A trial will convince you of their merits.

**These lamps, both "Twin" and Single, after an exhaustive competitive test, were adopted for use in Brooklyn for low tension street lighting and are now in successful operation.**

We manufacture all kinds of focusing lamps, search lamps, theatrical lamps, stereopticon lamps, and special lamps of any description. In short, if you want ***anything*** in the line of arc lamps, write us before purchasing elsewhere.

We are prepared to furnish promptly ornamental lamps of handsome design, for either direct or alternating current, finished to suit the customer.

THE

# "CLARK" WIRE.

TRADE MARK.

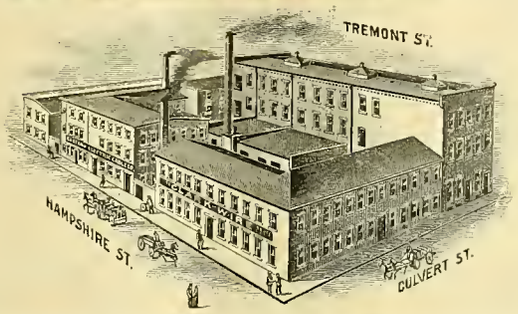
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

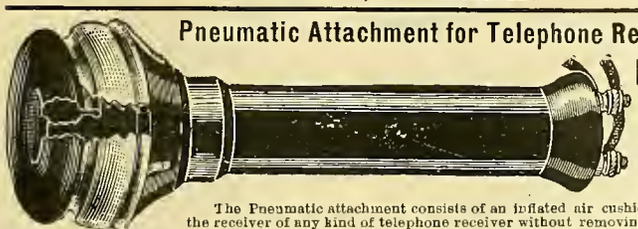
Pneumatic Attachment for Telephone Receivers.



[Pat. Feb. 20, 1894.]

Improves the hearing 25 per cent.

The Pneumatic attachment consists of an inflated air cushion, clasped to the receiver of any kind of telephone receiver without removing or altering same in any way. It increases the hearing for the reason that, being pneumatic, when placed to the ear it conforms to its shape, concentrates the sounds, and no sound can escape from the receiver; also excludes all exterior sounds. Any induction noise or buzzing sounds coming from the wires cannot affect the hearing, as the Pneumatic Attachment, being made of springy substance, when pressed to the ear regulates the distance of the receiver from the ear drum and avoids concussion of the ear. **MANISTEE, MICH.**

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C., August 25, 1894.

Sealed proposals (in duplicate) will be received at the Department of the Interior until 3 o'clock p. m. Monday, September 24, 1894, for the construction of a Telephone Exchange System for the Department of the Interior and at the same time and place proposals will also be received for the extension and modification of the present Telephone System of the Interior Department. Bids must be made on Government blanks. Blank forms of proposal, specifications, etc., may be obtained on application at the office of the Chief Clerk of the Department, where drawings showing details may also be inspected. All proposals received will be opened at the time and place above stated, and bidders are invited to be present at such opening.

JNO. M. REYNOLDS, Acting Secretary.

## SEALED PROPOSALS

Will be received by the City of Jackson, Tenn., until 12 o'clock noon, October 2, 1894, for furnishing, operating and maintaining forty double arc 2,000 candle power electric lamps on the streets of said city, with the privilege of 50 at the same price per light, for a term of five years. An exclusive franchise will also be granted for all arc and incandescent lighting for both commercial and domestic use for a term of five years. For specifications, etc., apply to

SAM C. LANCASTER,
City Engineer.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

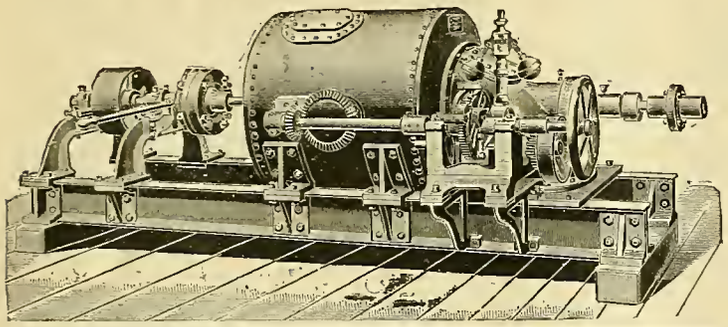
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

# PERFECT AND LONG-LASTING INSULATION

Assured by the Use of

**SIMPLEX T. Z. R. WIRE** *FOR LINE WORK.*

**SIMPLEX BRAIDED CAOUTCHOUC** *FOR INSIDE WIRING.*

**SIMPLEX MINING WIRE** *FOR MINES AND EXTREMELY DAMP PLACES.*

**SIMPLEX LEAD COVERED AND ARMORED CABLES**
*FOR UNDERGROUND AND SUBMARINE WORK.*

**SIMPLEX INSULATING PAINT,** *NOT THE CHEAPEST, BUT THE BEST.*

**SIMPLEX ELECTRICAL CO.,** Western Office, 1137-1138 Monadnock, Chicago.

# THE IMPERIAL TELEPHONES

Are Sold Outright. Positively Simple. Guaranteed Satisfactory. Suitable for Exchange or Private Line Plants. It is the Best. It is the Cheapest. It Works Perfectly. It can be sent anywhere. It cannot get out of order. It can be put up by anyone. It is the lowest price telephone of its grade. It is guaranteed satisfactory in every way. It is a battery phone combining the best theory and practice. It has fewer parts than any other telephone on the market and is self adjusting. It operates over long or short lines. It presents a neat and attractive appearance. To Electric Light Companies in towns where they have a complete pole system, the Imperial Telephone Works will make great inducements. The Imperial has led users to the conclusion that it is the most reliable. We are prepared to fully equip Telephone Exchanges, furnish everything. Railroad Companies are dispensing with Telegraph service and are using Telephones, of which a large number are now in use. We make you the following offer: Buy two sets of the Imperial and make your own tests; if satisfactory the way is open for more business. We will ship to anyone, a set of our Imperial Telephones for $35.00; if not satisfactory you may return them and we will refund your money. Send in your order at once.

# Central Electric Company,

173-175 Adams Street,
Chicago, Ill.

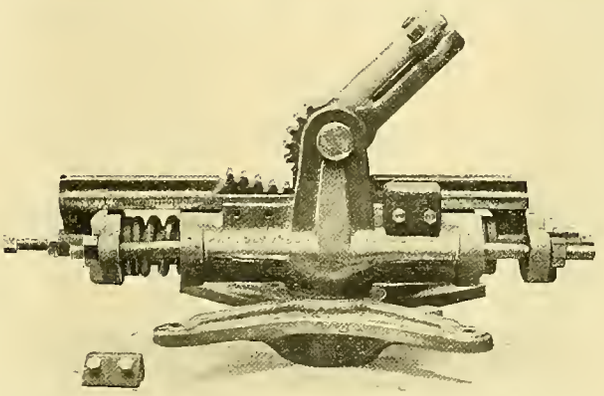
The Falk Trolley.

**The Trolley Wheel and Harp** which we illustrate here, is one that has met with general approval wherever used. It is of **simple construction** and **few parts,** but embodies an economic feature that belongs to no other wheel. It has case hardened **steel cone bearings,** arranged in such manner that while they allow a perfectly free revolution of the wheel, there can be no wabbling, rattling or side movement. A coiled spring contained *inside* the harp frame keeps the cones true to the bushings.

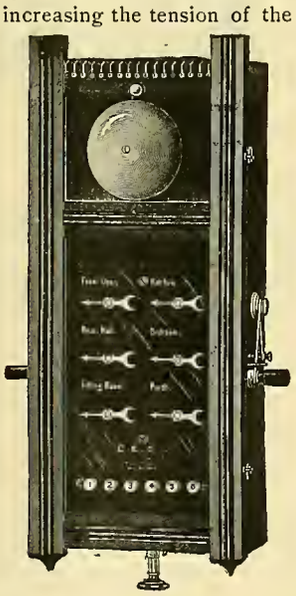
This entire device is made of the best steel. We consider the deep grooved steel wheel much superior to brass or bronze, but will supply them if preferred by customer. The wheel can be detached from harp in one minute for inspection or repairs. **An improved feature** is the "dope" chamber inside the wheel. This will hold sufficient lubricant to last many miles of travel. Thirty cars can be inspected and oiled in ninety minutes. No grease or oil will drip or leak out.

**Let us send you a sample for trial and comparison with any other wheel you have in use.**

## The Chicago Trolley Base



Is substantially built, omitting everything not essential to strength and perfect operation of the parts. THE TROLLEY ARM can be pulled down flat on the car top without increasing the tension of the spring. This relieves it of the catapult feature of all other bases. The castings are of malleable iron, smooth finish and painted.



**Prices and descriptive circulars mailed to any address.**

**In Our House Goods Department** we have several hundred annunciators, in assorted sizes and various wood finishes.

We are making a particularly LOW PRICE on the Detroit Burglar Alarm Annunciator. Don't neglect to send your name for one of the special lists mentioned last week.

*Orders and correspondence given prompt attention.*

THE

# "CLARK" WIRE.

TRADE MARK.

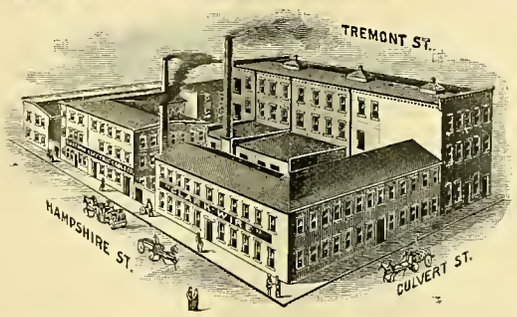
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**

**GREAT WESTERN MFG. CO.,**

**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used to insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## STUDY ELECTRICITY AT HOME

By our correspondence method. Thorough instruction, with FREE APPARATUS. Moderate terms. Diplomas awarded. Catalogue free. **Scientific Machinist Co.,** 90-91 Atwater Bldg., Cleveland, O.

## FOR SALE.

One 50-light Standard arc 2,000 C. P. dynamo; one 50-light American arc 2,000 C. P. dynamo; one 45-light T.-H. arc 1,200 C. P. dynamo; about twenty (20) smaller arc machines; all machines have a full complement of lamps; one 2 500-light National alternator; one 750-light Westinghouse alternator; one 760-light Slattery alternator; one 500-light T.-H. alternator; all station instruments are with machines. Hard time prices.

**CHAS. E. GREGORY CO.,**
47 and 49 South Jefferson Street, CHICAGO, ILL.

## PORCELAIN MANUFACTORY.

## For Sale, Cheap.

Two 50-light Western Electric Arc, ten ampere, 2,000 C. P. Dynamos.
One 20-light Western Electric Arc, ten ampere, 2,000 C. P. Dynamo.
One hundred Western Electric Arc Lamps.
Five hundred light transformer capacity.
One 100 H. P. Russell Automatic Cut-off Engine.
One 100 H. P. Phoenix Automatic Cut-off Engine.
One 125 H. P. Steam Boiler.
One 100 H. P. Steam Boiler.
Two Iron Stacks.
All of the above machinery is as good as new. Will be sold cheap. For particulars address

**CITIZENS ELECTRIC LIGHT & POWER CO.,**
W. R. FABEN, Receiver,
**MANISTEE, MICH.**

Send for NEW CATALOGUE. Out August 1st.

## NEW DYNAMOS FOR SALE.

We are offering for sale the following Dynamos which are good reliable machines, and never been used, at about one-half their original selling price, because they are not of the latest manufacture:

One 300 Light Direct Current Constant Potential Dynamo.
One 150 Light Direct Current Constant Potential Dynamo.
One 50 H. P. 500 Volt Constant Potential Bipolar Generator.
All built by the National Electric Mfg. Co.
One 1,000 Light Slattery Alternator with Exciter and Instruments.

**National Electric Co.,**
**EAU CLAIRE, WIS.**

## ASSIGNEE'S SALE

OF THE

## Southern Engineering Co.'s Business,

Consisting of lease on a very desirably located and well fitted electrical supply house, with well assorted and complete stock of electrical supply goods. Also electrical repair and jobbing shop, well equipped with new and modern machinery and good repair and jobbing trade already established. City of 200,000 inhabitants and only one competitor.

An enterprising man with a few thousand dollars can make a profitable investment.

Bids will be received on the whole, or for stock and machinery separately, until 20th day of September, 1894.

**Fidelity Trust & Safety Vault Co., Assignee,**

SOUTHERN ENGINEERING CO.,

206 to 210 Fifth Street, - LOUISVILLE, KY.

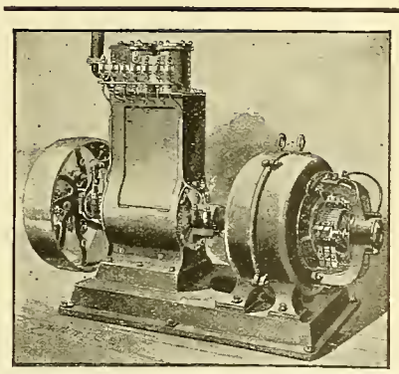
## NORTH STAR POINTS

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

## ORDERS

For any electrical book published filled promptly on receipt of price.

ELECTRICIAN PUBLISHING COMPANY,
6 Lakeside Building, Chicago.



## LUNDELL DYNAMOS AND MOTORS.

**Direct Current, Slow Speed, Iron Clad,**

**In Sizes up to 30 Kilowatts.**

Lundell Dynamos directly connected to any type of high speed engines.

For Lundell Dynamo and Motor catalogues, prices, etc., address the

## WANTED.

Position wanted as superintendent or electrician of electric light plant. Have had technical training and five years' experience in construction and station work. Good references. Address "AMERICAN,"
P. O. Box 545, Kenosha, Wis.

## POSITION WANTED.

To take full charge of arc lamps in a central station. Capable to keep 800 to 950 arc lamps in good repair; six years' experience with T.-H., American, Brush and Wood arc lamps. Highest references.

Address **"Arc Lamp,"**
Care WESTERN ELECTRICIAN,
6 Lakeside Building, Chicago.

## POSITION WANTED.

As electrical engineer, by graduate of Columbia College Electrical Engineering School. Thorough training in theory and practice of the electrical science. Experience in designing dynamo electrical machinery and installing plants.

Address **A. S.,**
Care WESTERN ELECTRICIAN,
6 Lakeside Bldg., Chicago.

## WANTED.

We will pay 15c each for clean copies of the WESTERN ELECTRICIAN dated:

August 26, 1893, Vol. xiii, No. 9.
October 7, 1893, Vol. xiii, No. 15.
November 4, 1893, Vol. xiii, No. 19.
May 26, 1894, Vol. xiv, No. 21.
May 19, 1894, Vol. xiv, No. 20.
January 13, 1894, Vol. xiv, No. 2.
February 10, 1894, Vol. xiv, No. 6.
March 10, 1894, Vol. xiv, No. 10.
April 7, 1894, Vol. xiv, No. 14.

**WESTERN ELECTRICIAN,**
6 Lakeside Building, Chicago.

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C., August 25, 1894.

Sealed proposals (in duplicate) will be received at the Department of the Interior until 3 o'clock p. m. Monday, September 24, 1894, for the construction of a Telephone Exchange System for the Department of the Interior and at the same time and place proposals will also be received for the extension and modification of the present Telephone System of the Interior Department. Bids must be made on Government blanks. Blank forms of proposal, specifications, etc., may be obtained on application at the office of the Chief Clerk of the Department, where drawings showing details may also be inspected. All proposals received will be opened at the time and place above stated, and bidders are invited to be present at such opening.

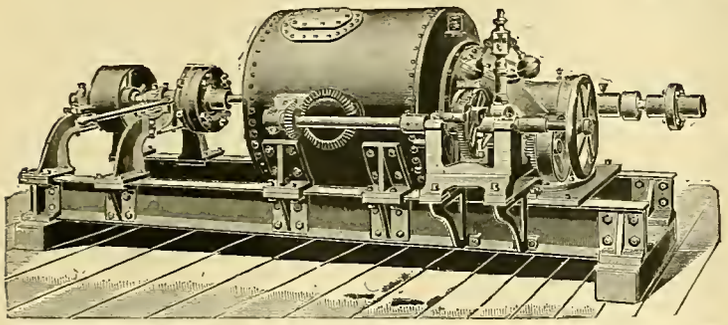
JNO. M. REYNOLDS, Acting Secretary.

## SEALED PROPOSALS

Will be received by the City of Jackson, Tenn., until 12 o'clock noon, October 2, 1894, for furnishing, operating and maintaining forty double arc 2,000 candle power electric lamps on the streets of said city, with the privilege of 50 at the same price per light, for a term of five years. An exclusive franchise will also be granted for all arc and incandescent lighting for both commercial and domestic use for a term of five years. For specifications, etc., apply to

**SAM C. LANCASTER,**
**City Engineer.**

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

AN ECLIPSE.

## THE LICK OBSERVATORY

Telescope reveals that this planet, known amongst scientists by the name of the Law Double Cylinder Cell Planet, "throws into the shade" a cluster of specks, *i. e.:* other cell planets, which, on being measured by the latest and best instruments obtainable, are readily seen to bear, proportionally to above planet, this space ⁘, hence wir fragen: Ist es zu bewundern dass es ein Finsterniss gibt? Die Antwort kann nur sein: Freilich nicht.

**LAW BATTERY COMPANY, 85 John Street, New York.**

Manufacturers of other Law Cells, Sal Ammoniac, Zincs, Carbons, Bluestone, Plunge Batteries, etc.

*N. B.—The Law Double Cell is patented; we own the patents and are the only ones having the right to manufacture them. Space will not permit mention of our other patents.*

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

### THREE HOME SEEKERS' EXCURSIONS

To all parts of the West and Northwest via the Chicago, Milwaukee & St. Paul Railway at practically half rates. Round trip tickets, good for return passage within twenty days from date of sale, will be sold on September 11 and 25 and October 9, 1894.

For further information apply at Ticket Office, 207 Clark Street, Chicago.

## GRAPHITE SPECIALTIES

**FOR ELECTRICAL USES:**

**Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the Inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.**

**JOS. DIXON CRUCIBLE CO., Jersey City, N. J.**

## Lakeview, Washington.

A model manufacturing location. Special inducements offered to manufacturers. Unexcelled facilities for coal and lumber, and shipment by rail and water. Eighty ton iron and steel rolling mill (only one in the state) now being built. Address

THE SOUTH TACOMA COMPANY,
P. O. Box 207, - Tacoma, Washington.

### Sleepers Between Chicago and Milwaukee.

The Chicago, Milwaukee & St. Paul Railway is now running sleeping cars with drawing rooms on night trains between Chicago and Milwaukee. Sleepers can be taken in Union Passenger Station any time between 9:30 and midnight, train leaving Chicago at 3:00 a. m., arriving at Milwaukee at 5:15 a. m., passengers remaining in sleepar until 7:30 a. m. Similar arrangements Milwaukee to Chicago. Berth rate $1.50. For further particulars, for tickets and berths, apply at City Ticket Office, 207 Clark St (Telephone Main 2190), or at Ticket Office, Union Passenger Station.

## PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current — How Produced — Induction — Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting— Testing— Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel— Multiple Series — Multiple Series Cut-Out — Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators— Brushes — Different Styles of Brushes — Double Brushes—Single Brushes—Troubles with Commutators and Brushes — Correct Position of Brushes — Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

## PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers—Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from Those Used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

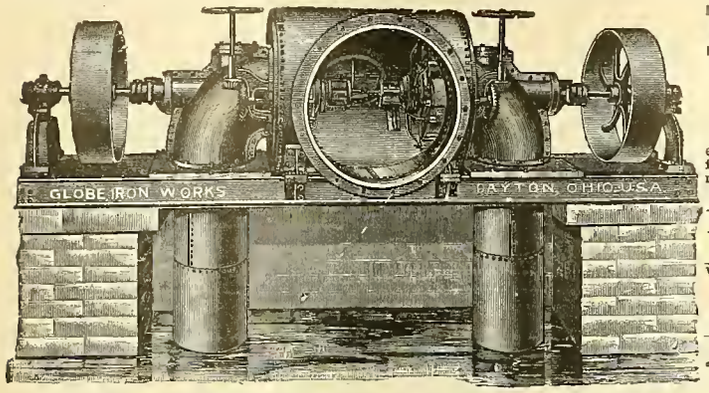
3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago, Illinois.**



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

**THE JAMES LEFFEL & CO.** SPRINGFIELD, OHIO, AND NEW YORK CITY.

# Electric Lighting Specifications.

By E. A. MERRILL,

*176 Pages. Price, prepaid, $1.50.*

# Central Electric Company,

173-175 Adams Street,
Chicago, Ill.

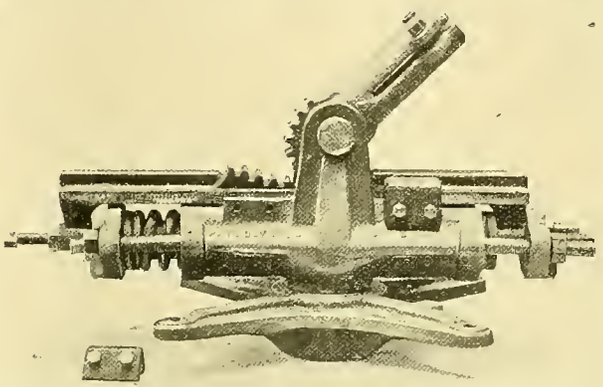
The Falk Trolley.

**The Trolley Wheel and Harp** which we illustrate here, is one that has met with general approval wherever used. It is of **simple construction** and **few parts**, but embodies an economic feature that belongs to no other wheel. It has case hardened **steel cone bearings**, arranged in such manner that while they allow a perfectly free revolution of the wheel, there can be no wabbling, rattling or side movement. A coiled spring contained *inside* the harp frame keeps the cones true to the bushings.

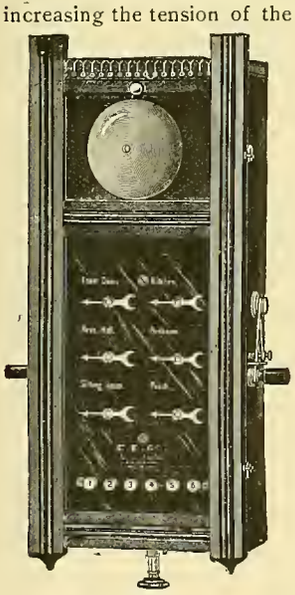
This entire device is made of the best steel. We consider the deep grooved steel wheel much superior to brass or bronze, but will supply them if preferred by customer. The wheel can be detached from harp in one minute for inspection or repairs. **An improved feature** is the "dope" chamber inside the wheel. This will hold sufficient lubricant to last many miles of travel. Thirty cars can be inspected and oiled in ninety minutes. No grease or oil will drip or leak out.

**Let us send you a sample for trial and comparison with any other wheel you have in use.**

## The Chicago Trolley Base



Is substantially built, omitting everything not essential to strength and perfect operation of the parts. THE TROLLEY ARM can be pulled down flat on the car top without increasing the tension of the spring. This relieves it of the catapult feature of all other bases. The castings are of malleable iron, smooth finish and painted.



**Prices and descriptive circulars mailed to any address.**

**In Our House Goods Department** we have several hundred annunciators, in assorted sizes and various wood finishes.

We are making a particularly LOW PRICE on the Detroit Burglar Alarm Annunciator. Don't neglect to send your name for one of the special lists mentioned last week.

*Orders and correspondence given prompt attention.*

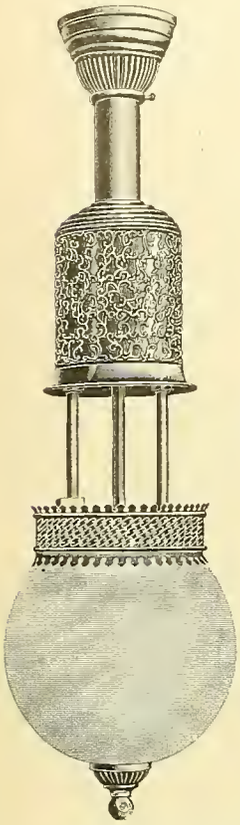
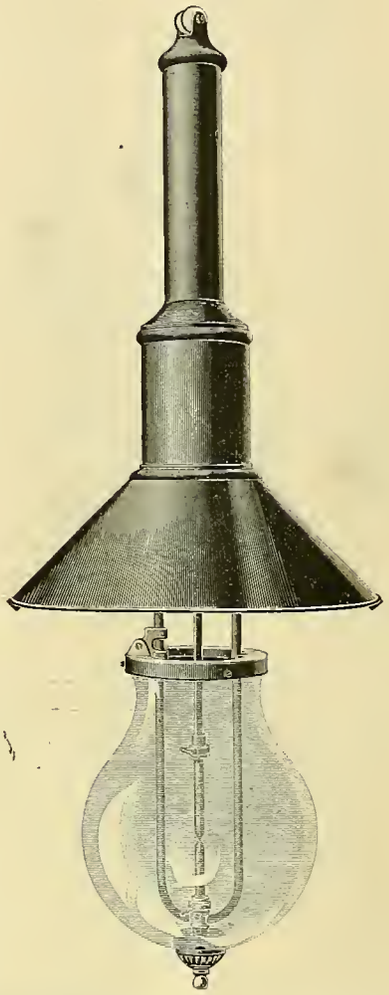
# THE BEST LAMP ON EARTH.



For Direct Current.
For Street Railway Circuits.
For Alternating Circuits.
For Series Arc Circuits.

## NEW AND SUPERIOR.

These lamps are far better than anything manufactured in the line of arc lamps—stronger, simpler, more durable and easier to maintain. They are ALL weatherproof. A trial will convince you of their merits.



**These lamps, both "Twin" and Single, after an exhaustive competitive test, were adopted for use in Brooklyn for low tension street lighting and are now in successful operation.**

We manufacture all kinds of focusing lamps, search lamps, theatrical lamps, stereopticon lamps, and special lamps of any description. In short, if you want ***anything*** in the line of arc lamps, write us before purchasing elsewhere.

We are prepared to furnish promptly ornamental lamps of handsome design, for either direct or alternating current, finished to suit the customer.

# ELECTRIC CONSTRUCTION & SUPPLY CO.,

THE

# "CLARK" WIRE.

TRADE MARK.

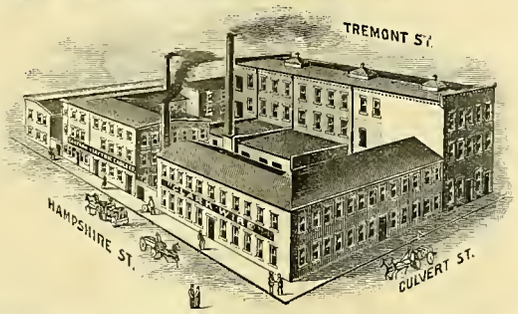
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## LUNDELL DYNAMOS AND MOTORS.

**Direct Current, Slow Speed, Iron Clad,**

In Sizes up to 30 Kilowatts.

Lundell Dynamos directly connected to any type of high speed engines.

For Lundell Dynamo and Motor catalogues, prices, etc., address the

**Interior Conduit & Insulation Co.**
44 Broad St., N. Y.

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C., August 25, 1894.

Sealed proposals (in duplicate) will be received at the Department of the Interior until 3 o'clock p. m. Monday, September 24, 1894, for the construction of a Telephone Exchange System for the Department of the Interior and at the same time and place proposals will also be received for the extension and modification of the present Telephone System of the Interior Department. Bids must be made on Government blanks. Blank forms of proposal, specifications, etc., may be obtained on application at the office of the Chief Clerk of the Department, where drawings showing details may also be inspected. All proposals received will be opened at the time and place above stated, and bidders are invited to be present at such opening.

JNO. M REYNOLDS, Acting Secretary.

## PLANS and SPECIFICATIONS

For a water works and electric plant will be on file in the Mayor's office on and after September 26, 1894. Parties desiring to bid on the plant may secure a copy of the same on request.

**W. H. Runkle,** Mayor,
Lisbon, Iowa.

## SEALED PROPOSALS

Will be received by the City of Jackson, Tenn., until 12 o'clock noon, October 2, 1894, for furnishing, operating and maintaining forty double arc 2,000 candle power electric lamps on the streets of said city, with the privilege of 50 at the same price per light, for a term of five years. An exclusive franchise will also be granted for all arc and incandescent lighting for both commercial and domestic use for a term of five years. For specifications, etc., apply to

SAM C. LANCASTER,
City Engineer.

## ASSIGNEE'S SALE

OF THE

**Southern Engineering Co.'s Business,**

Consisting of lease on a very desirably located and well fitted electrical supply house, with well assorted and complete stock of electrical supply goods. Also electrical repair and jobbing shop, well equipped with new and modern machinery and good repair and jobbing trade already established. City of 200,000 inhabitants and only one competitor.

An enterprising man with a few thousand dollars can make a profitable investment.

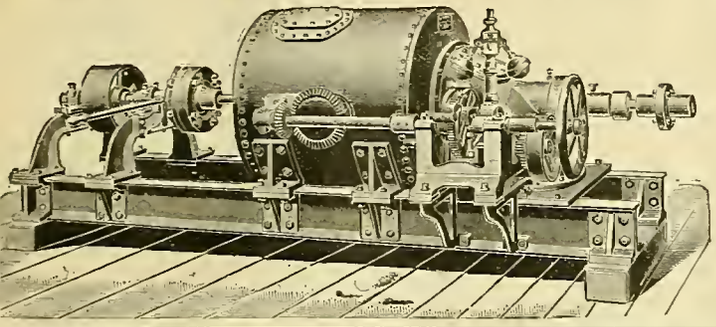
Bids will be received on the whole, or for stock and machinery separately, until 20th day of September, 1894.

**Fidelity Trust & Safety Vault Co., Assignee,**
SOUTHERN ENGINEERING CO.,
206 to 210 Fifth Street, - LOUISVILLE, KY.

## NORTH STAR POINTS

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

## TO TELEPHONE COMPANIES:

Kindly bear in mind that the cell which gives an ample and uniform current from first to last, causes the fewest interruptions, and requires the fewest renewals in a given time, is, beyond doubt, the best for telephone work; and that such is the Law Double Cylinder Cell.

## TO BELL-HANGERS:

Do not overlook the fact that if you do good work you will acquire a reputation that will eventually bring you in more money than if the contrary were the case, and in order to do good work that the Law Double Cylinder Cell is the cell for you to use.

## TO RAILROAD ELECTRICIANS:

We would suggest that, inasmuch as the Law Double Cylinder Cell is acquiring an envious reputation amongst railroad men for its efficiency and durability, it would be well worth your while to give it at least a trial.

Various other Law Cells, Zincs, Sal Ammoniac, Carbons, etc.

N. B.—We own the patents covering the Double Cylinder Cell and are the only ones having the right to manufacture it.

**LAW BATTERY COMPANY, 85 John Street, New York.**

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced*. No telephone can be built with these wonderful advantages *without the use of a lever*. The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company owns the first and only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

## THREE HOME SEEKERS' EXCURSIONS

To all parts of the West and Northwest via the Chicago, Milwaukee & St. Paul Railway at practically half rates. Round trip tickets, good for return passage within twenty days from date of sale, will be sold on September 11 and 25 and October 9, 1894.

For further information apply at Ticket Office, 207 Clark Street, Chicago.

## GRAPHITE SPECIALTIES

**FOR ELECTRICAL USES:**

**Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the Inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.**

**JOS. DIXON CRUCIBLE CO., Jersey City, N. J.**

## The "New Era" ELECTRIC GAS LIGHTERS.

**Newly Improved.**

**Are the only Electric Lighters made that are successfully operated by the key,**

Which always indicates whether the gas is on or off. Safe, reliable; will not fail to light; have interchangeable stems; are adaptable to any fixtures, and fully guaranteed. Made in 5 styles but all on the same general principle as style shown. Candle, Billiard, Argand. Our **Victor** with side lever, is a little wonder.

NEW
## DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages. 138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS.
"TRAMS."

*Their Construction, Operation and Maintenance.*

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*600 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

*THE PRACTICAL MANAGEMENT*
OF
## DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
**Engineers and Architects.**

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.
*Experiments with Alternate Currents.*

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

## Continuous Current
# Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turn-tables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

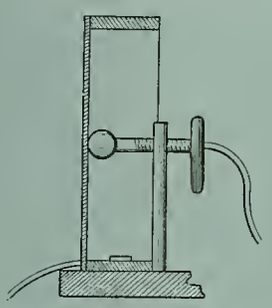

FIG. 44. BERLINER'S FIRST TRANSMITTER.

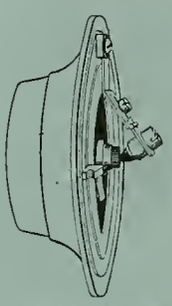

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by cans-

# SIMPLEX.

If you want a wire that will wear through a tree without impairing the insulation—
If you want a wire that will stand up under all condi.ions—
If you want a wire that will outlast any other on the market—

Buy SIMPLEX T. Z. R. Weatherproof, it is cheapest in the end.

## SIMPLEX BRAIDED CAOUTCHOUC.

Highest excellence, uniform in quality—the ideal rubber-covered wire for concealed work.
Write for prices. Prompt shipments from Chicago stock. No intermediate profits to be taken into consideration.

**We Quote Factory Prices.**

## SIMPLEX ELECTRICAL CO., Western Office, 1137-1138 Monadnock, Chicago.

# OUR SPECIALTIES.

## HABIRSHAW WIRES AND CABLES.
The Highest Grade of Rubber Insulation.

## ELECTRIC CONSTR. & SUPPLY CO.'S
ARC LAMPS FOR ALL CIRCUITS.
"The Best Lamp on Earth."

## ROBINSON PATENT TROLLEY WHEEL.

## HOPE STANDARD ARC CUT-OUTS.
Approved by every Board of Fire Underwriters.

## SHIELD BRAND MOISTUREPROOF WIRE.

## BRILLIAK INCANDESCENT LAMP.
Gives Best Return for Current Used.

## WIRT PATENT DYNAMO BRUSH.
Prevents Sparking and Cutting of Commutators.

## W. W. LIGHTNING ARRESTER.
Thoroughly Protects Apparatus.

## ELECTRIC LIGHTING MATERIAL.
## ELECTRIC RAILWAY SUPPLIES.
## ELECTRICAL HOUSE GOODS.

Good Goods. Low Prices. Prompt Shipments. Write for What You Want.

## WALLACE ELECTRIC CO., 307 Dearborn Street, CHICAGO.

## R. D. NUTTALL COMPANY, Allegheny, Pa.

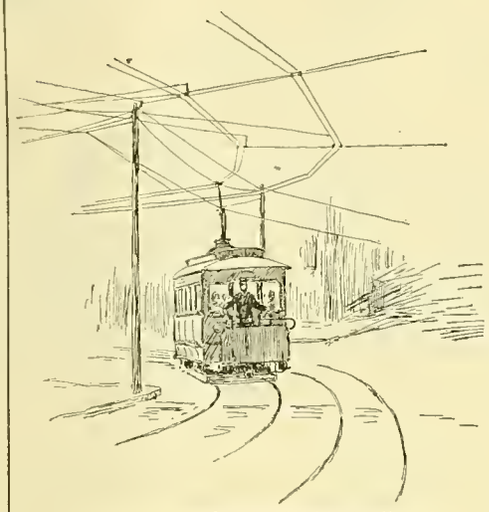
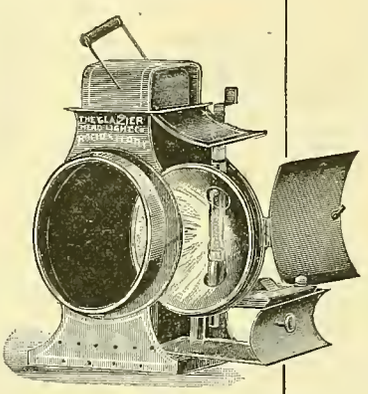
CHAS. A. CAVAONA, Neave Building, Cincinnati, Ohio, Central States Sales Department.



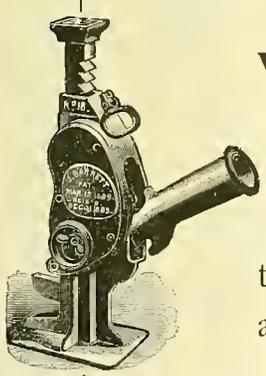
Are we coming to double trolleys?

# In our Railway Department

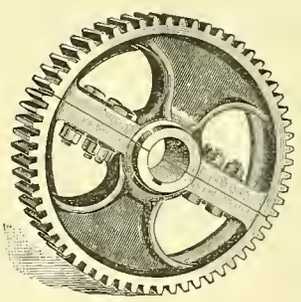
you can find a score of good things that we are willing to guarantee the best in the market. That may read a little old-fashioned, but the goods themselves are blessed with the latest wrinkles that smart inventors have racked out of their teeming brains. The aim has been, and will be, to select those devices which do the work in the simplest manner with the least amount of mechanism.



QUALITY is considered paramount to price, but the prices are utterly devoid of fancy frills and come as near being hard-pan as we know how to figure them and still maintain friendly relations with our landlord.



**We know** that we can satisfy the most finical and exacting buyer; the era of flim-flam in the electrical business has, happily for all concerned, reached a low ebb; the goods that we ship out, from whatever department, must be as we represent them or you get your money back without argument.



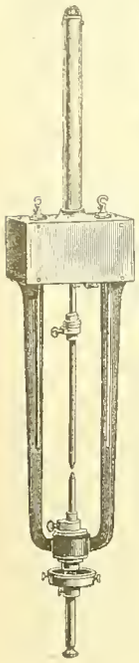
**What we want is orders** and they will be filled exactly as specified and shipped with gratifying promptness.

**HAVE YOU RECEIVED ONE OF OUR HOUSE GOODS SPECIAL LIST?**

BRANCHES:
St. Louis: Southern Electrical Supply Co.
Kansas City: Gate City Electric Co.

GENERAL WESTERN AGENTS
Okonite Wires, Interior Conduit, Lundell Fans, Helios Arc Lamps, Washington Carbons, Carpenter Enamel Rheostats.

**Central Electric Company,**
173-175 Adams Street,
Chicago, Ill.



# STANDARD "WARD" LAMPS

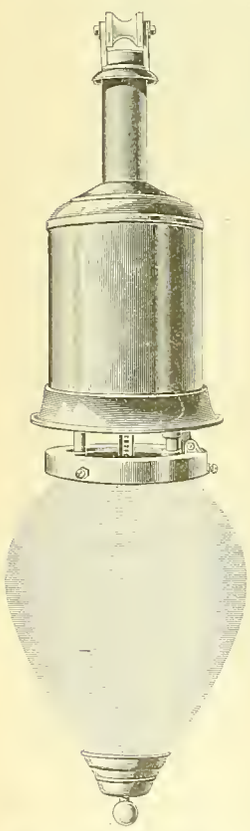
## For Direct Current, 110 Volts,

# TEN DOLLARS EACH

**With Globe and Resistance $2.00 Extra.**

**There are more lamps of the above type in use in the United States on Incandescent Circuits, than all other makes combined.**

# Send in Your Orders Quickly!



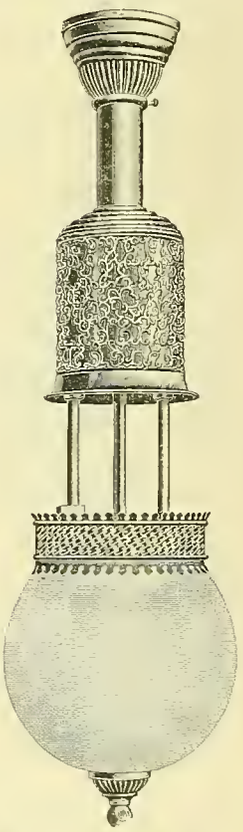
We have a complete line of Lamps for

Alternating Circuits,
Series Arc Circuits,
Direct Current, plain and ornamental
and Street Railway Circuits,
*AT FAIR PRICES.*

**STRONGEST, SIMPLEST,
MOST DURABLE,
EASIEST TO MAINTAIN.**

We manufacture all kinds of Focusing Lamps, Search Lamps, Theatrical Lamps, Stereopticon Lamps and Special Lamps of any description.

If you want ANYTHING in the line of Arc Lamps, write us before purchasing elsewhere.



# ELECTRIC CONSTRUCTION & SUPPLY CO.,

*Established 1881.*

## Harrison International Telephone.

**We either sell our telephones outright or lease them for a term of years.**

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 492,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

Offices, Chamber of Commerce Bldg., Chicago.

# The Electric Motor and its Applications.

By T. C. MARTIN AND JOSEPH WETZLER,

With an Appendix by Dr. Louis Bell, bringing the book down to date.

*Cloth.* *315 Large Quarto Pages, 353 Illustrations.* *Price, $3.00.*

The wealth of information contained in the three hundred and odd large double-column pages of this important work is equalled in few special technical treatises, even those of a professedly exhaustive character. More than one hundred different motors are described and illustrated—many in great detail—and the different applications are similarly fully treated. Many of the illustrations are full page, and the details of construction, particularly of armatures, are fully illustrated. The treatment is simple, clear, and concise, and little mathematics is employed, the work being essentially of a practical and largely of a descriptive character. The section on alternating motors resumes in a simple manner without mathematical formulæ, the principles upon which they are based, and that on thermo-magnetic motors treats this interesting class in greater detail than can be found in any other publication. An interesting feature is the historical method of treatment, by means of which the different steps in the advance of theories and design can be clearly traced, and the varying results of explorations in many directions instructively followed.

CONTENTS.

Chapter I. Elementary Considerations.—Chapter II. Early Motors and Experiments in Europe.—Chapter III. Early Motors and Experiments in America.—Chapter IV. The Electrical Transmission of Power.—Chapter V. The Modern Electric Railway and Tramway in Europe.—Chapter VI. The Modern Electric Railway and Street-car Line in America.—Chapter VII. The use of Storage Batteries with Electric Motors for Street Railways.—Chapter VIII. The Industrial Application of Electric Motors in Europe.—Chapter IX. The Industrial Application of Electric Motors in America.—Charter X. Electric Motors in Marine and Aerial Navigation.—Chapter XI. Telpherage.—Chapters XII, XIII. Latest American Motors and Motor Systems.—Chapter XIV. Latest European Motors and motor Systems.—Chapter XV. Alternating Current Motors.—Chapter XVI. Thermo-magnetic Motors.—Appendix The development of the Electric Motors since 1888.

THE

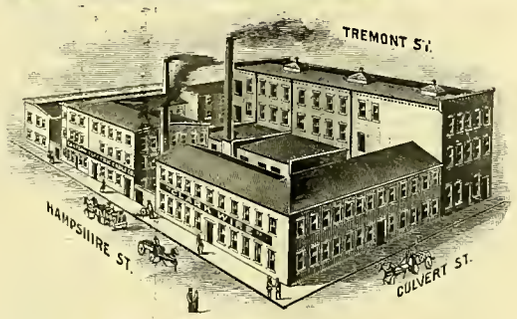
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**
**GREAT WESTERN MFG. CO.,**
**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

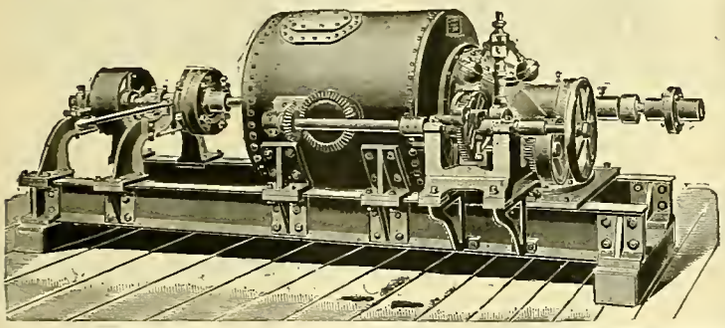
## SEALED PROPOSALS

Will be received by the City of Jackson, Tenn., until 12 o'clock noon, October 2, 1894, for furnishing, operating and maintaining forty double arc 2,000 candle power electric lamps on the streets of said city, with the privilege of 50 at the same price per light, for a term of five years. An exclusive franchise will also be granted for all arc and incandescent lighting for both commercial and domestic use for a term of five years. For specifications, etc., apply to

SAM C. LANCASTER,
City Engineer.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**The Stilwell-Bierce & Smith-Vaile Co., Dayton, O.**

## TO TELEPHONE COMPANIES:

Kindly bear in mind that the cell which gives an ample and uniform current from first to last, causes the fewest interruptions, and requires the fewest renewals in a given time, is, beyond doubt, the best for telephone work; and that such is the Law Double Cylinder Cell.

## TO BELL-HANGERS:

Do not overlook the fact that if you do good work you will acquire a reputation that will eventually bring you in more money than if the contrary were the case, and in order to do good work that the Law Double Cylinder Cell is the cell for you to use.

## TO RAILROAD ELECTRICIANS:

We would suggest that, inasmuch as the Law Double Cylinder Cell is acquiring an envious reputation amongst railroad men for its efficiency and durability, it would be well worth your while to give it at least a trial.

Various other Law Cells, Zincs, Sal Ammoniac, Carbons, etc.
N. B.—We own the patents covering the Double Cylinder Cell and are the only ones having the right to manufacture it.

**LAW BATTERY COMPANY, 85 John Street, New York.**

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

### THREE HOME SEEKERS' EXCURSIONS

To all parts of the West and Northwest via the Chicago, Milwaukee & St. Paul Railway at practically half rates. Round trip tickets, good for return passage within twenty days from date of sale, will be sold on September 11 and 25 and October 9, 1894.

For further information apply at Ticket Office, 207 Clark Street, Chicago.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

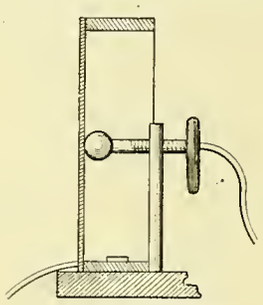

FIG. 44. BERLINER'S FIRST TRANSMITTER.

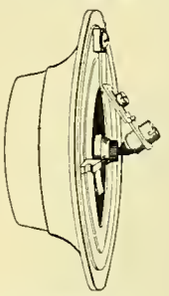

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by cans-

NEW
## DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages.* *138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS. "TRAMS."
*Their Construction, Operation and Maintenance.*
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages.* *Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## *THE PRACTICAL MANAGEMENT OF* DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages.* *Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.
*Experiments with Alternate Currents.*
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages. 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

# WESTINGHOUSE ELECTRIC & MFG. CO.,

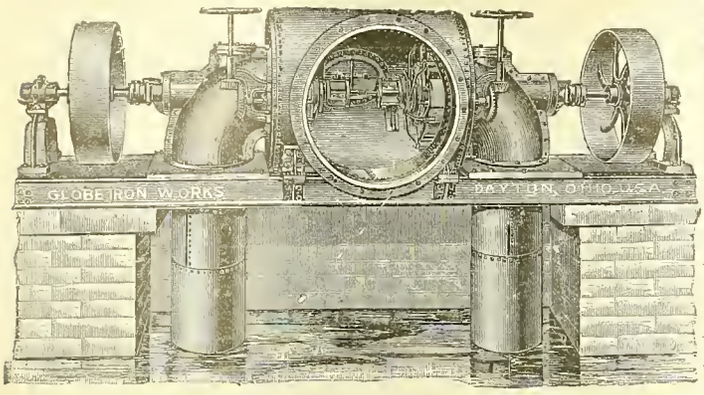
MANUFACTURERS OF

**Electric Generating, Lighting and Railway Apparatus,**

**PITTSBURGH, PENNSYLVANIA.**

It has been brought to our attention that certain small dealers in electrical apparatus have recently offered for sale armature coils purporting to be suited for use upon our electric railway motors. We direct attention to the fact that these coils, and the devices for manufacturing them, are fully covered by our patents No. 488,016 dated December 13, 1892, and No. 520,143 dated May 22, 1894. We shall immediately proceed to enforce our rights under these patents against the manufacturers of the infringing article, and also against any parties who purchase and use them. The patents above referred to have heretofore been generally respected.

WESTINGHOUSE ELECTRIC & MFG. CO.



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.58 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195 19 | 82.58 |
| ¾ " | 16.78 | 117.33 | 112 60 | 175 74 | 82.18 |
| ⅝ " | 17.03 | 111.83 | 98.12 | 149.99 | 79.31 |
| ½ " | 16.88 | 118.67 | 82.17 | 1 8 40 | 75.52 |

Test of a 42-inch Wheel-July 14, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.33 | 128.00 | 154.18 | 199.56 | 80.50 |
| ⅞ " | 16.56 | 134.80 | 120.85 | 188.14 | 83.09 |

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

## Continuous Current

# Dynamos and Motors:

THEIR THEORY, DESIGN, AND TESTING.

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

AN ELEMENTARY TREATISE FOR STUDENTS.

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter X V. Steam-Engine Calculations.—Appeodix I. Tests of Iron.—Appendix II. Ampere Turn-tables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# THE ALTERNATING CURRENT MOTOR PROBLEM SOLVED.

THE

# MONOCYCLIC SYSTEM,

## A COMPLETE CENTRAL STATION SYSTEM FOR SIMULTANEOUS LIGHT AND POWER.

**Incandescent Lamps, Arc Lamps and Motors Operated from the same Generator Economically and Efficiently.**

### CHARACTERISTICS OF THE MONOCYCLIC SYSTEM:

It operates lights and motors, in parallel, on the same generator and even the same transformer.

It solves the hitherto unsolved problem of the alternating current motor. By the use of this system, alternating current motors may be operated which are not only equal, but superior to continuous current motors. They have a constant speed, are extremely simple and absolutely reliable; and have neither commutator, collector rings, brushes nor moving wires.

Low tension underground networks may be operated on the Edison three wire system and the largest part of copper expended in feeders saved, as it is possible to use high tension feeders and transformers. A better balance is secured and the network may be extended unlimitedly.

It is as simple as the ordinary well-known alternating system. It differs from it only in its ability to operate high grade motors by means of a **THIRD OR POWER WIRE** which is carried only to the motors and resembles the *neutral wire* of the Edison three wire system.

It allows perfect operation of the whole system of generators in parallel and thereby enables the whole lighting and power station to be operated from three bus-bars only, the third intermediate bus-bar being for motor supply.

It will operate, by the use of two transformers, three phase, quarter phase or any other type of alternating current motors.

It gives a perfect regulation of the whole system, as all difficulties caused by self induction or capacity are eliminated. Current may be transmitted over any distance, in consequence of its low frequency—7,200 alternate.

It is operated with generators and transformers of an hitherto unattained efficiency and regulation.

The generators and motors are both slow speed.

# GENERAL ELECTRIC COMPANY.

**PRINCIPAL SALES OFFICES:**

MAIN OFFICE, SCHENECTADY, N. Y.

Boston, Mass., 180 Summer Street.
New York, N. Y., 44 Broad Street.
Syracuse, N. Y., 244 West Fayette Street.

THE

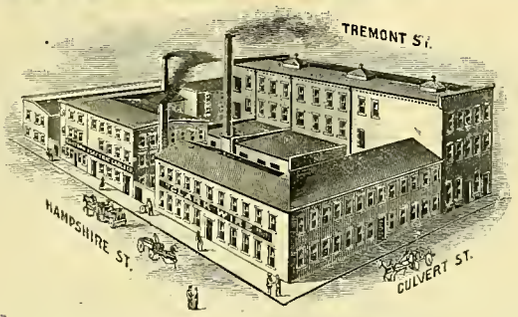
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
**GREAT WESTERN MFG. CO.,**
Chicago, Ill.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# *Siemens & Halske Electric Company of America,*

*Siemens & Halske. Berlin, Charlottenburg, Vienna, St Petersburg.*

MANUFACTURERS OF

# DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

**HIGH-SPEED BELTED SIEMENS DYNAMOS**

Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

**ALTERNATING AND MULTIPHASE CURRENT DYNAMOS**

With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

**MOTORS**

Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H P. Durable and economical in operation.

**SIEMENS BAND LAMPS**

For direct and alternating current, for constant potential and series machines.

**SIEMENS ARC LIGHT CARBONS**

With either solid or soft cores, which are the most economical in the world and give a steady light.

**ALL INSTRUMENTS**

Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

## BIDS WANTED.
Sealed bids will be received by the Chairman of the Light Committee of the City Council of the City of Sterling, Ill., until October 15, 1894, at 5 o'clock p. m., for lighting the streets of the city by electricity. Incandescent lamps of twenty five (25) actual candle power each, to the number of two hundred (200) lights, to be suspended at street intersections, or on poles at such other places as the city may direct. The terms of the contract to be for a period of ten (10) years from November 6, 1894; the city to have the option to increase the number of lamps at any time, at the same rate. The successful bidder to have the exclusive franchise for commercial lighting. A certified check, payable to the order of the Mayor, for the sum of three hundred ($300) dollars must accompany each bid, as a guarantee that the party to whom the contract is awarded will, within ten (10) days, execute an acceptable bond and sign contract.
Any further information desired will be furnished by the Chairman of the Committee. The Council reserves the right to reject any or all bids.
JOHN MEE,
Chairman Light Committee.

## Sale of Electrical Works.
Notice is hereby given that pursuant to the decree and order of the circuit court of Delaware county, Indiana, made at its September term, 1894, in cause No. 8195 therein, in which Frederick A. Van Namee is plaintiff and James Chamberlain is defendant, as Receiver appointed by said court after the 16th day of October, 1894, I will sell, by private contract, to the highest and best bidder, free and clear from any and all liens, as one whole parcel, all the machinery, manufactured machines, motors and dynamos, machines in process of manufacture, tools, implements, stock of material, office furniture and all other tangible property constituting the plant and manufactory of the Muncie Electrical Works. Such sale to be subject to confirmation by the court aforesaid and will be made at the office of C. E. Shipley, attorney, southeast corner of Walnut and Jackson streets, city of Muncie, Indiana, where, or at Nickey's drug store, southwest corner of Main and Mulberry streets, Muncie, Indiana, I will receive bids.
TERMS OF SALE:—One-half cash; one-fourth payable in three months and one-fourth payable in six months from the day of sale; deferred payments to bear six per cent. interest from date till due and secured by note of the purchaser with good approved security.
JAMES N. CROPPER,
Receiver Muncie Electrical Works.
C. E. SHIPLEY, Attorney for Receiver.

## WANTED.
I am competent to fill any position from Machinist to Superintendent or Electrician for electric railroad or manufactory; am a practical mechanic and an educated electrician and manufacturer of dynamos and motors; have had superintendence and designing of one of the largest motor manufactories for 3 years. I want a position, and willing to do anything which offers a future. Address "B. W. S.," care WESTERN ELECTRICIAN, 6 Lakeside Building, Chicago.

## WANTED.
Position wanted as superintendent or electrician of electric light plant. Have had technical training and five years' experience in construction and station work. Good references. Address "AMERICAN,"
P. O. Box 545, Keoosha, Wis.

## POSITION WANTED.
By young man to take charge of a small arc or isolated plant. Six years of practical experience. Capable of winding and repairing armatures and keep arc lamps and transformers in good order. Familiar with engines.
Address A. T.,
Care WESTERN ELECTRICIAN,
6 Lakeside Building, Chicago

## SITUATION WANTED
With electric light and power company or isolated plant, by young electrician with four years' experience at in and outside construction and station work. Steady work with chance to rise instead of high wages. Good references.
Address H. C. L.,
Care WESTERN ELECTRICIAN,
6 Lakeside Building, Chicago.

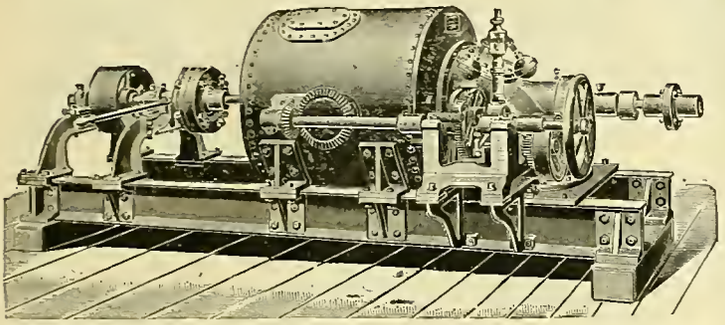
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

---

## Never Argy Agin a Success.

Every TELEPHONE requires a SWITCH HOOK. We have got the only device that will do the required work and not infringe in any one of the 128 patents owned by the Bell Company. Our device will operate with any style or weight of receiver. Send for testimonial circulars, price list, etc.

## The Electric Motor and its Applications.

By T. C. MARTIN AND JOSEPH WETZLER,

With an Appendix by Dr. Louis Bell, bringing the book down to date.

***Cloth. 315 Large Quarto Pages, 353 Illustrations. Price, $3.00.***

The wealth of information contained in the three hundred and odd large double-column pages of this important work is equalled in few special technical treatises, even those of a professedly exhaustive character. More than one hundred different motors are described and illustrated—many in great detail—and the different applications are similarly fully treated. Many of the illustrations are full page, and the details of construction, particularly of armatures, are fully illustrated. The treatment is simple, clear, and concise, and little mathematics is employed, the work being essentially of a practical and largely of a descriptive character. The section on alternating motors resumes in a simple manner without mathematical formulæ, the principles upon which they are based, and that on thermo-magnetic motors treats this interesting class in greater detail than can be found in any other publication. An interesting feature is the historical method of treatment, by means of which the different steps in the advance of theories and design can be clearly traced, and the varying results of explorations in many directions instructively followed.

CONTENTS.

Chapter I. Elementary Considerations —Chapter II. Early Motors and Experiments in Europe. —Chapter III. Early Motors and Experiments in America.—Chapter IV. The Electrical Transmission of Power.—Chapter V. The Modern Electric Railway and Tramway in Europe.—Chapter VI. The Modern Electric Railway and Street-car Line in America.—Chapter VII. The use of Storage Batteries with Electric Motors for Street Railways.—Chapter VIII. The Industrial Application of Electric Motors in Europe.—Chapter IX. The Industrial Application of Electric Motors in America.—Chapter X. Electric Motors in Marine and Aerial Navigation.—Chapter XI. Telpherage.—Chapters XII, XIII. Latest American Motors and Motor Systems.—Chapter XIV. Latest European Motors and motor Systems.—Chapter XV. Alternating Current Motors.—Chapter XVI. Thermo-magnetic Motors.—Appendix. The development of the Electric Motors since 1888.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.
The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.58 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195 19 | 82.58 |

# THE ALTERNATING CURRENT MOTOR PROBLEM SOLVED.

THE

# MONOCYCLIC SYSTEM,

## A COMPLETE CENTRAL STATION SYSTEM FOR SIMULTANEOUS LIGHT AND POWER.

## Incandescent Lamps, Arc Lamps and Motors Operated from the same Generator Economically and Efficiently.

### CHARACTERISTICS OF THE MONOCYCLIC SYSTEM:

It operates lights and motors, in parallel, on the same generator and even the same transformer.

It solves the hitherto unsolved problem of the alternating current motor. By the use of this system, alternating current motors may be operated which are not only equal, but superior to continuous current motors. They have a constant speed, are extremely simple and absolutely reliable; and have neither commutator, collector rings, brushes nor moving wires.

Low tension underground networks may be operated on the Edison three wire system and the largest part of copper expended in feeders saved, as it is possible to use high tension feeders and transformers. A better balance is secured and the network may be extended unlimitedly.

It is as simple as the ordinary well-known alternating system. It differs from it only in its ability to operate high grade motors by means of a **THIRD OR POWER WIRE** which is carried only to the motors and resembles the *neutral wire* of the Edison three wire system.

It allows perfect operation of the whole system of generators in parallel and thereby enables the whole lighting and power station to be operated from three bus-bars only, the third intermediate bus-bar being for motor supply.

It will operate, by the use of two transformers, three phase, quarter phase or any other type of alternating current motors.

It gives a perfect regulation of the whole system, as all difficulties caused by self induction or capacity are eliminated. Current may be transmitted over any distance, in consequence of its low frequency—7,200 alternate.

It is operated with generators and transformers of an hitherto unattained efficiency and regulation.

The generators and motors are both slow speed.

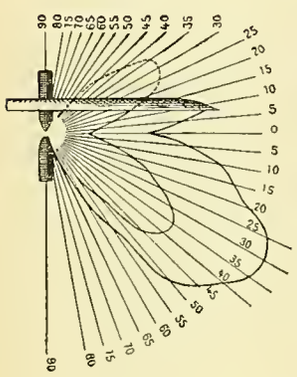
Office, 1409-1410
Manhattan Bldg., Chicago, Ill.

# A GREAT REDUCTION
## IN PRICES
ON OUR



# Reflector Plate Alternating ARC LAMPS.

We claim better distribution of light than any other alternating lamp in the market. We accomplish this by means of **OUR REFLECTOR PLATE.**

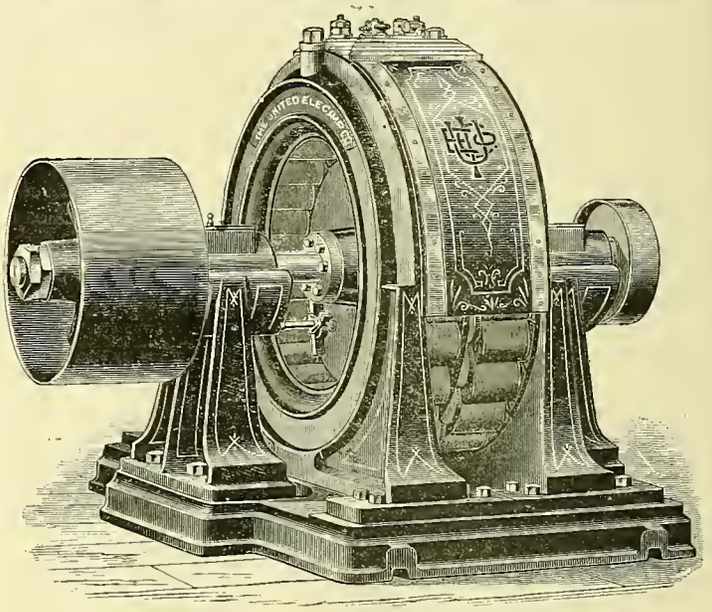
We claim that we can obtain more economy than any other alternating lamp in the market. We do this by means of the **SPENCER ECONOMY COIL.**

We will beat the market for prices on Helios carbons this fall.

# Helios Electric Co.,
1310 Filbert St., PHILADELPHIA, PA.

# Alternating Current Generators,
**For Central Station Equipment.**

Adapted for Arc and Incandescent Lighting.
Guaranteed Equal in Every Respect to any other Type of Apparatus Manufactured.



Slow Speed and Close Regulation. Standard of Simplicity and Durability.

**ALSO**

Direct Current Apparatus for Lighting Factories, Public Buildings and Isolated Plants.
Improved Long Distance Series Incandescent Apparatus for Street and Commercial Illumination.
Incandescent Lamps and Sockets for use on Arc Light Circuits.

**Correspondence Solicited.**

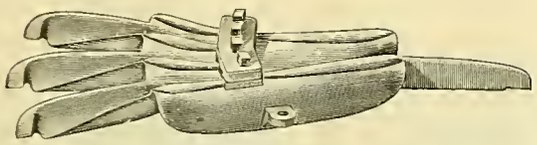
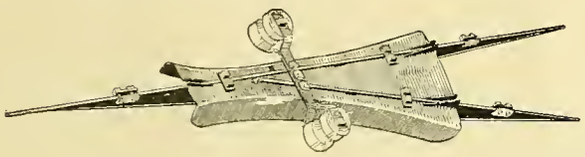
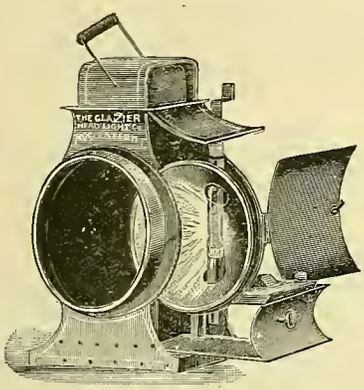
It isn't necessary for us to croak much about



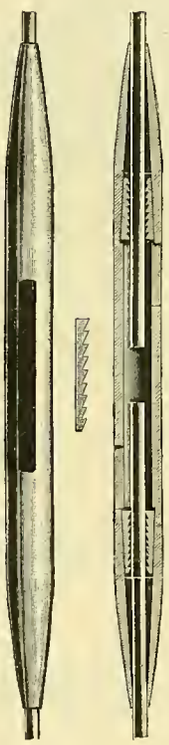
our Trolley Frogs, they are the best made, and

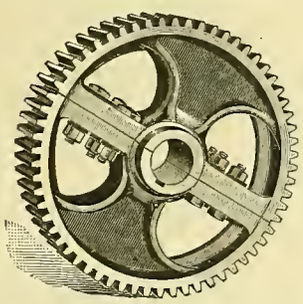


are as lightly constructed as consistent with strength.

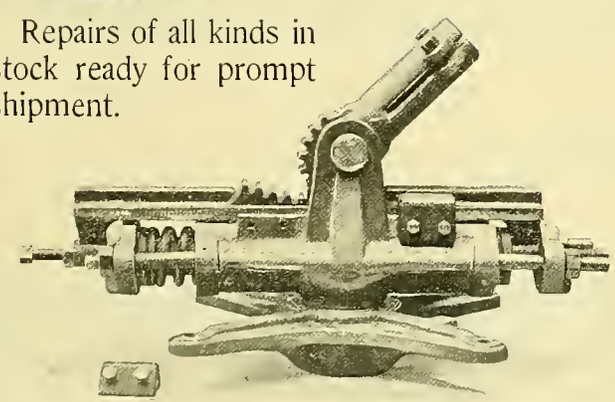


This Search Light used by the Civic Federation and all the Leading Railways.





Repairs of all kinds in stock ready for prompt shipment.



The Chicago Trolley Base is the most simple, durable and practical of any.

# We've got the grip

on the finest line of

## *Street Railway*

material that ever found a temporary abiding place in a Chicago store. We repeat what we said two weeks ago, that the aim has been and will be to select those devices which do the work in the simplest manner with the least amount of mechanism.

Quality is considered paramount to price, but the prices have been stripped of every fancy frill. If we can succeed in satisfying you with the quality first, we know we can satisfy you with the price.

Our general stock of

### *Electrical Supplies*

is the largest in the world.

# A Brand New Arc Lamp.

# THE A.-W. ARC LAMP.

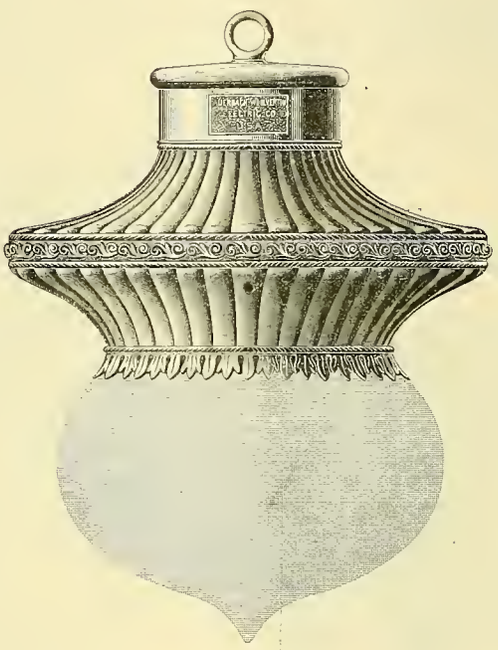
That burns on any current.

That measures 18 inches from top to bottom (including globe).

That has a life of 25 hours in the open air.

That throws light where you want it---on the ground.

That feeds neither by rack, clutch, clockwork, nor chain.



That casts no shadow whatever.

That gives the maximum light distribution.

That gives an absolutely steady light.

That keeps the arc stationary.

That feeds independent of the magnet.

## Simplicity and Durability of Construction.
## The Most Ornamental Lamp in the Market.

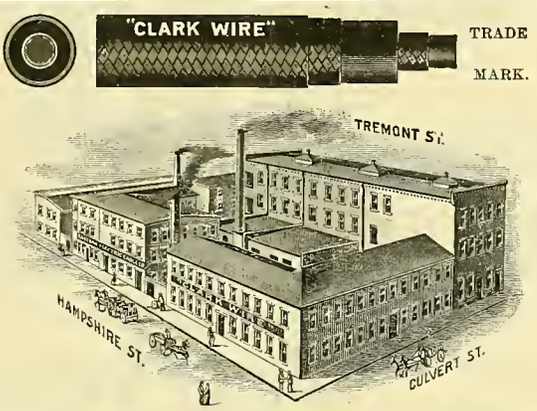
THE

# "CLARK" WIRE.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



TRADE MARK.

**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

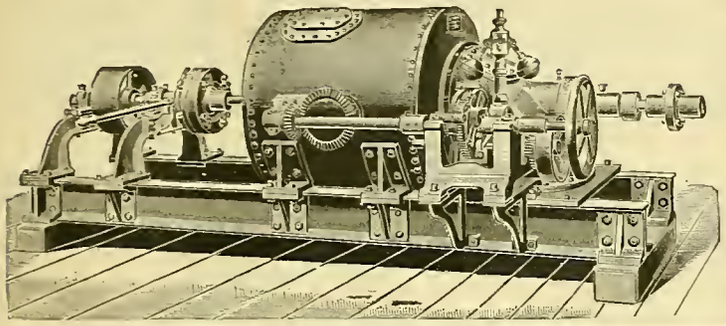
The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

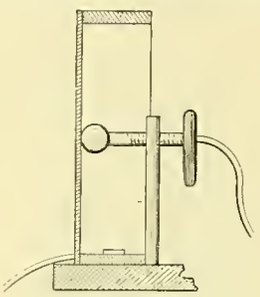

FIG. 44. BERLINER'S FIRST TRANSMITTER.

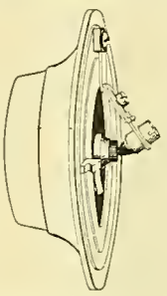

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

## THE NEW AMERICAN LEADS.

Recent improvemente made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

**THE JAMES LEFFEL & CO.** SPRINGFIELD, OHIO, AND NEW YORK CITY.

**THREE HOME SEEKERS' EXCURSIONS**

To all parts of the West and Northwest via the Chicago, Milwaukee & St. Paul Railway at practically half rates. Round trip tickets, good for return passage within twenty days from date of sale, will be sold on September 11 and 25 and October 9, 1894.

For further information apply at Ticket Office, 207 Clark Street, Chicago.

# 28 REASONS

Why Station Managers and Intending Purchasers Should Thoroughly Investigate the

# 1894 TYPE WOOD ARC DYNAMO:

1.—Because it has the highest commercial efficiency, over 90 per cent. at full load.

2.—Slow rotative speed 500 R. P. M. enabling it to be direct connected to an engine when required.

3.—Because the Armature and Shaft complete weigh but 2250 pounds and can be removed for repair or examination in fifteen minutes and without breaking a single connection.

4.—Because of the great number of coils on the Armature which are divided into nine independent groups, the potential between them being so low that there is little or no tendency for the coils to become short-circuited.

5.—On account of the comparatively large number of small sections with which this armature is wound, the current is practically constant, producing a minimum strain on the insulation of the line, and in no way affecting telephone, telegraph or signal service wires, it being well known in the art that dynamos with few armature coils producing pulsating currents, strain the insulation, and seriously affect wires in their immediate vicinity.

6.—The small size of each armature coil enables it in case of damage to be cut out, and the dynamo still operated; this cannot be done with dynamos having few and comparatively large coils on the armature without dangerous sparking.

7.—On account of the great radiating surface and very few turns of wire per section this armature keeps very cool.

8.—The regulating mechanism on this dynamo is constructed on a new principle, and when once adjusted cannot possibly get out of order.

9.—Its mechanism is enclosed in the pedestal where it is protected from the accumulation of dirt, or injury.

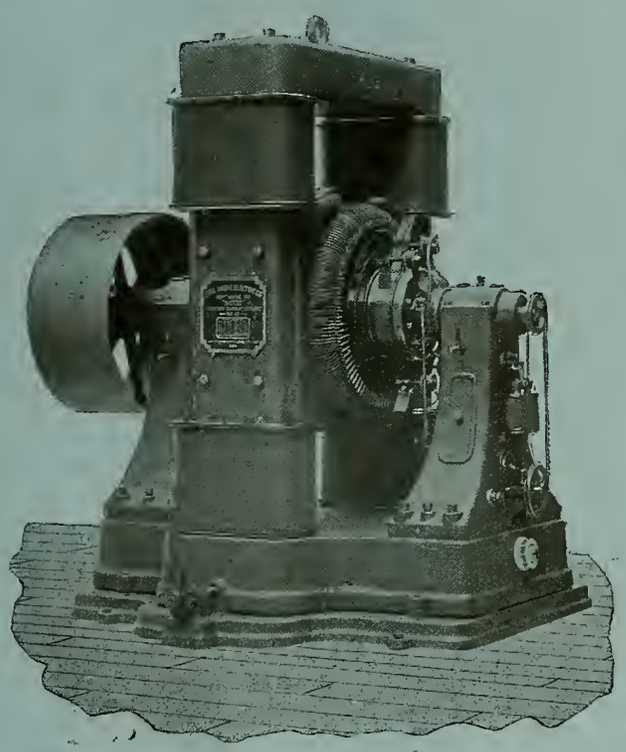
10.—It is practically instantaneous in its action, commutation taking place sparklessly at all loads.

11.—The commutator is mounted directly on the Spider to which it is rigidly connected, thereby obviating any tendency of the armature connections to crystalize or break, due to vibration.

12.—The commutator is of ample proportion for the service required of it; the brushes are copper and extra large, and as there is no sparking at the Commutator, such devices as carbon brushes and air blasts for the prevention of sparking are not required.

13.—All the brushes are set by a gauge accompanying the dynamo, the regulating mechanism being adjustable and constructed to compensate for any difference in armatures or machines.

14.—The brushes can be removed for trimming one at a time should it become necessary while the dynamo is running, and without interfering with the lights.



## Fort Wayne Electric Corporation,

**FORT WAYNE, - INDIANA.**

### BRANCH OFFICES:

NEW YORK CITY: 115 Broadway.
CHICAGO: 185 Dearborn Street.
PHILADELPHIA: 907 Filbert Street.
BOSTON, MASS.: 17 Federal Street.
PITTSBURGH, PA.: 405 Times Building.
SYRACUSE, N. Y.: Kirk Building.
COLUMBUS, O.: 57 East State Street.
SAN FRANCISCO: El. Imp. Co., 43 Stevenson Street.
NEW ORLEANS, LA.: Southern El. Mfg. & Supply Co.
MINNEAPOLIS, MINN.: New York Life Building.
CINCINNATI O: 208 Neave Building.
DALLAS, TEX.: Corner Main and Field Streets.
RICHMOND, VA: Chamber of Commerce.

15.—The surface of the commutator is solid, there being no air spaces for the accumulation of metallic dust between the segments, as is the case with dynamos having but few armature coils; as a result the vibration of the brushes and consequently increased wear, as well as unpleasant noise is prevented, this dynamo running absolutely noiseless.

16.—The dynamo and automatic regulating mechanism is self contained, and consequently does not require additional wall controllers, rheostats, motors, field commutators, exciters, etc., to assist in the regulation with their multiplicity of extra connections, fire risk and consequent danger.

17.—The switch for short circuiting the field is of new construction, instantaneous in its action and fire-proof.

18.—This dynamo can be connected in a few minutes to run in either direction, the regulator operating perfectly when run either way.

19.—The boxes are self-oiling, and are of the most improved construction; either box can be removed for inspection without removing either armature or pedestals.

20.—The field coils are wound on steel spools, which slip over the wrought iron core, and are so fastened that they can be easily removed should it become necessary.

21.—There are no loose wires or connections used in the circuits of this dynamo; every electrical connection is of the most substantial character.

22.—The insulation is of the best possible material throughout, and made to withstand a 10,000 volt alternating current.

23.—Every part of this dynamo has an ample amount of material, which is of the best quality for the work intended of it.

24.—The workmanship and finish is of the best possible character, all parts being made to gauge and interchangeable.

25.—It is in every sense a high grade dynamo, no attempt being made to save money at the expense of material or workmanship, the company recognizing that parties requiring such large dynamos want the best that can be had.

26.—The design from an artistic and mechanical point of view leaves absolutely nothing to be desired.

27.—It rests on a metal sliding base with an improved ratchet lever for tightening or loosening the belt.

28.—The floor space required is the smallest possible consistent with stability, and six or more of these dynamos in a station would make an imposing as well as a beautiful appearance.

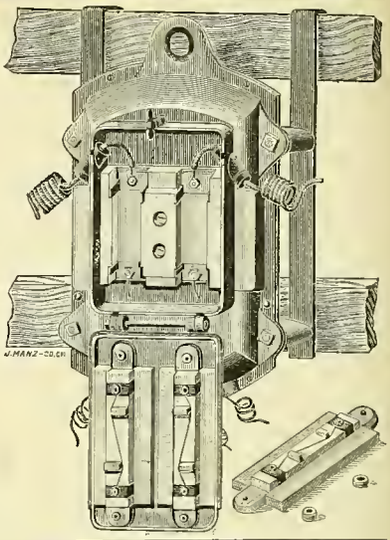
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

Chicago Office, 1307 Manhattan Building, Central Electric Co., Selling Agents.

# A BRAND NEW ARC LAMP.

# THE A.-W. ARC LAMP.

That burns on any current.

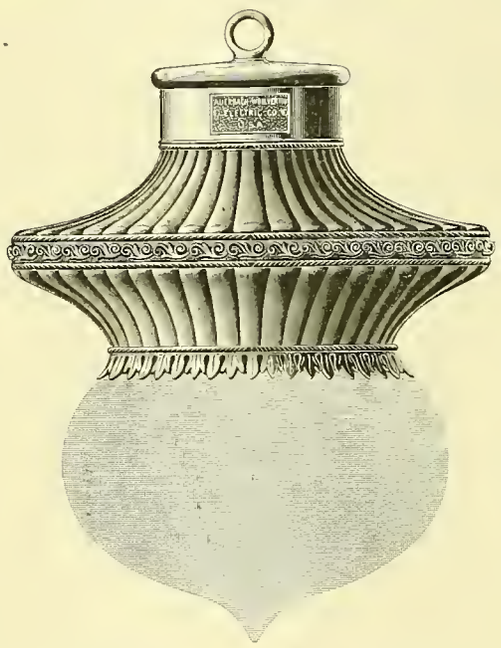
That measures 18 inches from top to bottom (including globe).

That has a life of 25 hours in the open air.

That throws light where you want it—on the ground.

That feeds neither by rack, clutch, clockwork, nor chain.

That casts no shadow whatever.



That gives the maximum light distribution.

That gives an absolutely steady light.

That keeps the arc stationary.

That feeds independent of the magnet.

**SIMPLICITY AND DURABILITY OF CONSTRUCTION.**

**THE MOST ORNAMENTAL LAMP IN THE MARKET.**

# AUERBACH-WOOLVERTON ELECTRIC CO.,

CHICAGO.

# Note! Important!

## Central Station Batteries.

"I. P. TYPE."

The facility with which any plate can be removed and replaced without interfering in the least with the operation of the battery in supplying electricity, storing surplus power or steadying the current, makes this the only type which meets all the requirements of central stations for light and power, and which enables the owner to maintain his battery at the highest pitch of efficiency.

# STANDARD "WARD" LAMPS

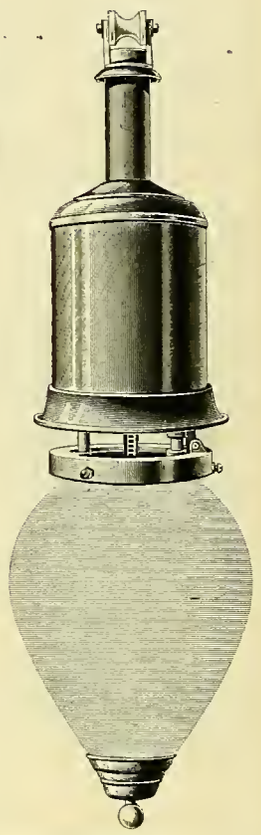
For Direct Current, 110 Volts.

## TEN DOLLARS EACH

**With Globe and Resistance, $2.00 Extra.**

There are more lamps of the above type in use in the United States on Incandescent Circuits, than all other makes combined.

## Send in Your Orders Quickly!



### ALTERNATING LAMPS.

Our new Alternating Lamp is the most economical and surest feed lamp on the market, burning from secondary circuits of 33, 50 or 100 volts.

Simplicity and strength of construction are the strong points of our lamps, rendering them more durable and easier to maintain than any others.

Lamps ENTIRELY WATERPROOF, dispensing with the use of hoods.

Write us for description and circular.

## THE ALTERNATING CURRENT MOTOR PROBLEM SOLVED.

# THE MONOCYCLIC SYSTEM,

## A Complete Central Station System for Simultaneous Light and Power.

***Incandescent Lamps, Arc Lamps and Motors Operated from the same Generator Economically and Efficiently.***

**CHARACTERISTICS OF THE MONOCYCLIC SYSTEM:**

*It operates Lights* and *Motors*, in parallel, *on the same generator and even the same transformer.*

*It solves the hitherto unsolved problem of the alternating current motor.* By the use of this system, alternating current motors may be operated which are not only *equal, but superior* to continuous current motors. They have a *constant speed*, are *extremely simple* and *absolutely reliable;* and have neither *commutator, collector rings, brushes nor moving wires.*

*Low tension underground networks* may be operated on the *Edison three wire system* and the *largest part of copper expended in feeders saved*, as it is possible to use *high tension feeders and transformers. A better balance* is secured and the *network may be extended unlimitedly.*

It is as *simple* as the *ordinary well-known alternating system.* It differs from it only in its ability to *operate high grade motors* by means of a **THIRD OR POWER WIRE** which is carried only to the motors and resembles the *neutral wire* of the *Edison three wire system.*

It allows *perfect operation* of the *whole system* of generators in parallel and thereby enables the *whole lighting and power station* to be operated from *three bus-bars only, the third intermediate bus-bar being for motor supply.*

It will operate, by the use of *two transformers, three phase, quarter phase or any other type of alternating current motors.*

It gives a *perfect regulation of the whole system,* as all difficulties caused by *self induction or capacity* are eliminated. Current may be transmitted over any distance, in consequence of its low frequency—7,200 alternate.

It is operated with *generators* and *transformers* of an hitherto unattained *efficiency* and *regulation.*

*The generators and motors are both slow speed.*

SUPPLYING
## LIGHT AND POWER.

New Type with Independent Plates which can be Easily Examined and Replaced without interfering with Charge or Discharge. Capacity from 350 to 12,000 Ampere Hours. No Nuts, Bolts or Screws. Meets all Requirements of Central Stations.

## SPECIAL TYPES FOR VARIOUS PURPOSES.

*STREET CAR TRACTION,*
*ELECTRIC LAUNCHES,*
*YACHT LIGHTING,*
*PHONOGRAPHS,*
*ELECTRO-PLATING,*
*ELECTRIC WELDING,*
*CAUTERY BATTERIES,*
*SAFETY LAMPS.*

## Harrison International Telephone.

**We either sell our telephones outright or lease them for a term of years.**

This company owns Letters Patent No. 476,200, granted to E. M. Harrison May 30, 1892, and Letters Patent No. 499,108, granted to E. M. Harrison June 6, 1890, for a complete electric speaking telephone operated by battery; and owns Letters Patent No. 435,295, granted to William Hutson Ford August 26, 1890, for an automatic switchboard. Our patents embrace every device necessary in the construction of a telephone plant with either manual or automatic switchboard.

Prospectuses furnished by addressing the Company at their offices,

Offices, Chamber of Commerce Bldg., Chicago.

woodwork is of polished mahogany, and the upholstering of peacock blue brocaded plush. There are 20 armchairs. The doors are double, acting in concert, and give sufficient space when opened to admit of a lady in full evening dress passing in and out without danger to her costume.

Treasurer Kobbe of the Westinghouse Electric company was in Boston recently in conference with the company's Boston directors. The Newark, N. J., factory, he says, will be removed to the new works at Brinton immediately.

A trolley railroad is proposed to run from the Merrimac valley in Massachusetts, through the White Mountain resorts of New Hampshire, to the St. Lawrence river.

A new telephone line is being strung between Westbrook and Gorham, Me.

The Union street exchange of the Providence, R. I., Telephone company will soon be completed.

A new electric street railway has been successfully opened between Athol and Orange, Mass.

Work on the new Hampden and Winterport, Me., electric road will begin as soon as the frost is out of the ground in the spring.

The state Legislature of Vermont, when it meets this month, will probably be asked to grant a special charter for an electric railway from Bennington to the New York state line, connecting with the Hoosick railway. J. C. E.

## PERSONAL.

Secretary M. A. Bird of the Wallace Electric company, Chicago, will attend the convention at Atlanta, Ga.

George A. McKinlock, president of the Central Electric company, Chicago, has returned to the city after an absence of some time.

A. B. Field of the Ionia Manufacturing company, Boston, Mass., was in Chicago last week looking over the western field in the interest of this company.

Friends of F. S. Kenfield, business manager of the *Street Railway Review*, Chicago, will be pleased to learn that invitations have been issued for his marriage on Wednesday evening, October 24th, to Miss Amy Sweeney of Rock Island, Ill. Mr. Kenfield has been confined to his room for some days past with a slight illness, but from the fact that the wedding invitations have been issued it is presumed that his indisposition is slight, and it is hoped by his many friends that it will not interfere with the happy event. Mr. Kenfield's many friends in the newspaper business and among the street railway men extend hearty congratulations, in which the WESTERN ELECTRICIAN joins.

## ELECTRIC LIGHTING.

San Francisco, Cal., will purchase a new engine, dynamo, etc., for enlarging an electric light plant.

Colton, Cal., will have a municipal electric light plant soon. The mayor has the matter in charge.

The question of a municipal electric light plant is to be discussed at the next meeting of the city council of Spokane, Wash.

Waukon, Ia., has granted an electric light franchise to Judge Hendrick, who proposes to commence the work of construction immediately.

Work will be commenced on the electric light plant to be constructed by Iowa Falls, Ia., shortly. The city clerk will furnish further particulars.

At a recent meeting of the board of trustees of Val'ejo, Cal., it was decided to establish a municipal electric light plant, and proposals are now invited for the lighting of the streets. The old electric light plant was destroyed by fire some weeks ago. The city clerk can furnish particulars.

## ELECTRIC RAILWAYS.

An electric road is to be built from Nevada City to Grass Valley, in California.

The Joplin, Mo., Electric Railway company proposes an extension of its line to Galena, Kas., a distance of eight miles.

Iowa City, Ia., is making an effort to get an electric street railway, and will secure it if $8,000 can be raised to unite with outside capital.

The charter for a new electric street railway was filed in Scranton, Pa., last month. It will run from Nanticoke to Aldin, thence to Wanamie and Glen Lyon. The incorporators are all Nanticoke men. The capital stock is $60,000.

## MISCELLANEOUS.

The annual meeting of the Cleveland Electrical club was held October 3d. The following named officers were elected: President, C. W. Wason; first vice-president, B. M. Barr; second vice-president, T. E. Adams; secretary, H. D. Davis; treasurer, E. W. Moore; board of managers, R. M. Fuller and George W. Cleveland.

## TRADE NEWS.

The Washington Electric company, Chicago, reports that it has installed a large number of the well-known Meissner stage regulators in various theaters throughout the country within the last few months.

The Wallace Electric company, Chicago, has issued a catalogue of electrical railway supplies that should be of interest to all electric railway men. This book shows the company's stock to be complete and to comprise a number of well-known articles of recognized merit.

The Mather Electric company of Manchester, Conn., reports the closing of a second contract with the Hartford & West Hartford Horse Railway company, Hartford, Conn., for two of its 180 kilowatt railway generators with new Mather station equipment, the first generator, which was installed a few weeks ago, having given perfect satisfaction.

The Electric Appliance company, Chicago, reports having secured the western agency for the well-known line of electric railway supplies of the Lynn Manufacturing company, and that it will carry a large stock in Chicago and be prepared to ship entire equipments from that point. Special catalogues and advertising matter are being prepared by the company, and will be ready for distribution shortly. In the meantime the Electric Appliance company will be pleased to hear from the electric railway trade, and desires opportunities to make prices on material for electric railway equipments. The Appliance company intends to make attractive prices on the high grade Lynn material, which includes one of the best railway insulations ever produced.

## BUSINESS.

The W. S. Hill Electric company reports business as good in all its lines, but especially brisk in switchboards, some particularly large and fine ones having recently been turned out.

The Metropolitan Electric company, Chicago, received an order last week for sixty-five miles of I. X. L. weather-proof wire from a customer who has already had fifty miles in use. This speaks well for this well-known insulation.

The organization of the Louisville Electrical Works at Louisville, Ky., is reported. The concern will manufacture electrical and mechanical specialties and repair electrical machinery and apparatus. It will be located at 148 Fifth street. The general manager is Campbell Scott.

The largest line of pattern letters to put on patterns for castings is made by H. W. Knight & Son, Seneca Falls, N. Y. They are constantly adding new styles and sizes and are abreast of the times in variety and prices. They have recently made shipments to Turkey and have an increasing trade in other foreign countries as well as in the United States. Try them with your next order, addressing Drawer 1256.

The Cortland & Homer Traction company has just closed the contract for the equipment for its entire steam plant. The specifications were drawn and contracts placed under the direction of Prof. R. C. Carpenter of Cornell University. The company will put in four compound condensing Watertown engines with pumps, condensers, heaters and four 100 horse power boilers manufactured by the Watertown Steam Engine company of Watertown, N. Y.

The Link Belt Machinery company, Chicago, reports the following recent sales of the standard water tube safety boilers: Plainwell Church Furniture company, Plainwell, Mich., 100 horse power; Mutual Electric Light & Power company, Chicago, 600 horse power; Pittsburg High School, Pittsburg, Pa., 250 horse power; Institute for the Feeble Minded, Pittsburg, Pa., 800 horse power, and Detroit Chamber of Commerce, Detroit, Mich., 300 horse power.

The Independent Electric company, Chicago, is headquarters in the West for slate for electrical purposes. All shapes and styles of finish are furnished on short notice. The company handles exclusively Vermont slate, which is known to be of the best quality. The Independent company has an elegant line of samples at its office at Thirty-ninth street and Stewart avenue, which it is pleased to show. The company reports business in this line to be improving.

The Central Electric company, Chicago, after having made exhaustive and careful tests of the B. & S. compounds and paints, will handle this product in the West, as general western agents. The company reports that it finds that the B. & S. products are among the highest insulating mediums of their kind on the market, and states that it will carry a large stock in its Chicago warehouse. The company has already secured sufficient orders to prove that the trade appreciates the superiority of this product.

The Mather Electric company of Manchester, Conn., reports the following recent sales in its isolated lighting department: North Packing & Provision company, Somerville, Mass., one 100 light dynamo; Hermann Ankam & Co., Lebanon, Pa., one 600 light dynamo; Church Green Electric Light & Power company, Boston, Mass., one 600 light dynamo; Iowa School for the Deaf, Council Bluffs, Ia., one 600 light dynamo; Connecticut River Paper company, Holyoke, Mass., one 700 light dynamo and two 15 horse power Manchester motors; Henry R. Worthington, Hydraulic Works, Brooklyn, N.Y., one 600 light dynamo, one 10 horse power motor and one 45 horse power 220 volt generator; the J. B. Williams company, Glastonbury, Conn., one 150 light dynamo; Graif Bros., Lake Crystal, Minn., one 150 light dynamo; Ohio State University, Columbus, O., one 13 horse power Manchester motor; Grenada Hotel, Chicago, Ill., one 450 light dynamo; Barney & Smith Manufacturing company, Dayton, O., one 3 horse power Manchester motor; B. T. Sturtevant & Co., Chicago, Ill., one 10 horse power Manchester motor; G. M. Angier & Co., Boston, Mass., one 100 light dynamo; Candee company, New Haven, Conn., one 50 light dynamo; Moorehouse Bros., Chanterice, Conn., one 50 light dynamo; Odd Fellows Hall, Philadelphia, Pa, one 30 kilowatt, one 50 kilowatt and one 80 kilowatt directly connected generator and 50 horse power in motors; S. N. Blake, Elmira, N. Y., one 350 light dynamo; Nardi, Strang & Co., Philadelphia, Pa., one 50 light dynamo; George W. Furbeck, Chicago, Ill., one 250 light dynamo; C. B. Boothe, Los Angeles, Cal., two 5 horse power and one 3 horse power Manchester motors; Badger Lumber company, Kansas City, Mo., one 100 light dynamo; Leafe Bros., Winchester, Va., one 50 light dynamo; Stanley Laboratory company, Pittsfield, Mass., one 10 kilowatt exciter; Diamond Machine company, Providence, R. I., one 300 light dynamo and West Virginia Improvement company, Pocahontas, W. Va., one 60 kilowatt 220 volt generator.

The exhibit of the General Electric company at the Atlanta convention will be of an elaborate nature. It will comprise motors, controller, other car equipment parts, station switchboard panels, line material, wattmeters, etc. The G. E. 800 motors will be shown not only in the exhibit proper, but, mounted on cars, will operate them over the lines of the Atlanta Street Railway company. Ample opportunity will be afforded for a close and critical examination of these motors and of the component parts which enter into their construction. The motors shown in operation will act in conjunction with the "K" controller, and those interested will be enabled to investigate the merits of the combination. The principle of the magnetic blowout device will also be shown and explained and its action demonstrated. This principle is embodied in all other devices in which electric arcs may occur, such as switches, fuses, lightning arresters, etc. Several sizes of generator and feeder panels for station switchboards, all of black marbleized slate with the necessary instruments mounted thereon, will also be shown. These panel boards are made in various capacities to suit the requirements of the plant, and have been devised so that the switchboards may be increased in size as the station grows merely by the addition of other panels. The line material exhibited will embody several improvements of an important character, which have become necessary by the increased demands of railroad service. The Thomson Recording wattmeter in its portable form for testing on moving cars will also form an important item of the exhibit, which will be illuminated by means of Thomson '93 arc lamps for railway circuits, connected in series and operating on the railway lines. They have been especially designed for use in power houses, car barns and elsewhere where light is desired from 500 volt circuit. The exhibit will also comprise samples of underground feeder tubing with models of junction boxes and taps, and among the literature which will be distributed will be found a special pamphlet dealing with the application of the three wire system to street railway work. The interests of the General Electric company will be in charge of W. J. Clark, general manager of the railway department. He will be assisted by W. H. Knight, chief engineer of the railway department, Theo. P. Bailey, H. H. Corson, H. J. Crowley, W. B. Potter, H. C. Wirt and A. K. Baylor. Visitors to the convention will find a warm welcome at the Atlanta office of the company and, indeed, anywhere where the General Electric company's representatives may be found.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued October 9, 1894.*

527,066. Device for Protecting Separately Excited Generators. Benjamin G. Lamme, Pittsburg, Pa. Application filed February 28, 1894.

The invention contemplates bringing the circuit of the field magnet and its exciter to a break, so that when the armature circuit is broken in the main generator the field magnet circuit is also broken. Thus two counteracting magnetisms are simultaneously developed. The two circuits will not interfere with each other, as the difference of potential between the two binding blocks at the break is normally zero. When, however, the break occurs under the action of the solenoid employed, the armature tends to drive current back through its field magnet. If the normal magnetization, therefore, be due to a current opposite in direction to the tendency of the armature, and the break be made, the armature will kill the magnetism of its own field magnet, and the generator will be immediately rendered harmless.

527,070. Electrical Converter. James W. Packard, Warren, O. Application filed January 3, 1894.

The invention consists of a converter having primary and secondary coils of wire and a series of plates encompassing both of the coils, and arranged in such manner that they will fit snugly together and form inner and outer rings presenting even surfaces, the entire series of plates forming a compact, nearly solid mass.

527,071. Electrical Fuse Box. James W. Packard, Warren, O. Application filed January 3, 1894.

The device patented comprises a hollow fuse box and a core of non-conducting material in which contact is maintained by a longitudinal spring pressure. It also comprises a fuse box having electrical connections at its ends, and a central core located in the box and held in fixed contact with the electrical connections. The invention further comprises a fuse box having electrical connections at its ends, a central core of non-conducting material, and a spring pressed longitudinally on the core for holding it securely in position.

527,075. Running Compound Wound Dynamo-electric Machines in Multiple. William B. Potter, Schenectady, N. Y. Application filed June 2, 1894.

This invention relates to running continuous current dynamo-electric machines in multiple, and has for its object to provide a method of starting up one or more machines after the other machines are running, without the difficulty attendant upon this operation in methods ordinarily practiced, and without the danger from excessive sparking and from the great rush of currents caused by ordinary methods.

527,092. Circuit Controller for Regulators. Barton B. Ward, New York, N. Y. Application filed October 13, 1893.

The device consists of a circuit controller in which a movable contact is actuated by a fluid pressure affected device or by a temperature affected device, or by any other automatically operating device, which is retained in engagement with a co-operating contact until a certain pressure is reached, and then instantaneously breaks the engagement.

527,098. Railway Annunciator. Charles R. Alsop, Middletown, Conn. Application filed November 2, 1893.

The main object of the invention is to effect improvements in railway annunciators, whereby the signal or call bell part will continue to be active until the bell circuit is mechanically broken, thereby preventing the possibility of the signal being accidentally unnoticed by the operator.

527,099. Electric Track Signal. Charles R. Alsop, Middletown, Conn. Application filed November 27, 1893.

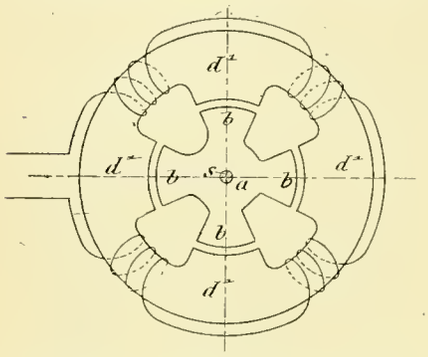
In an electric track signal the combination is described of suitably arranged separated contact springs, a signal circuit having the wires thereof connected separately to the springs, and a horizontal spring actuated contact lever mounted to play on a vertical pivot adjacent to one side of a track rail and normally out of contact therewith to leave a space of a width less than a car wheel flange, which is adapted to move the contact lever laterally between the contact springs.

527,126. Electric Locomotive. Nicolas J. Raffard, Paris, France. Application filed July 23, 1891.

This invention, which comprises improvements on a former patent, relates to an electric locomotive which is moved by one or more electric motors of any type, whose armatures or rotating bobbins are integral with hollow arbors placed concentric with the mean position of the axles. These hollow arbors turn in bearings attached to suspended frames, and transmit the movement to the drive wheels through the intermediation of elastic connections. The electric energy which actuates the electric motor is furnished either by electric batteries or by accumulators carried by the electric locomotive, or by any system of conductors in communication with a distant source of electricity.

527,127. Commutator Brush Holder. George Rauch, Milwaukee, Wis. Application filed April 28, 1894.

Novelty is claimed for an insulating base attachable to a commutator supporting frame, and brush holders connected to the base, each holder comprising a shell provided with a binding post and brush guide, a crank having a flanged arm run through the shell and its other arm loosely engaged with the brush guide, a rotarily adjustable washer on that arm of the crank engaging the shell, and a spiral spring connecting the washer and arm flange.



NO. 527,195.

527,150. Electric Ore Amalgamating Apparatus. John C. Ludwig, San Francisco, Cal. Application filed March 5, 1894.

The novel features of the apparatus comprise a sluice box or trough with a flat bottom and standing sides, a bottom plate of zinc or other suitable metal which is a good conductor, a flexible loosely lying apron or blanket formed of woven or flexible felted fabric capable of absorbing and retaining water upon the plate, and suitable electrical conductors and connecting means by which the plate is connected with one pole of a dynamo-electric machine, or other generator of electricity, and the blanket or apron is similarly connected with the other pole of the generator. Mingled pulp and water is fed in at the upper end of the apparatus upon the zinc plate, the sluice box being suitably inclined from that end downward to give the stream of pulp proper movement or rate of travel between the surface of the zinc and the overlying blanket.

527,177. Electric Switch. Raymond S. Kelsch, Chicago, Ill. Application filed May 28, 1894.

The switch, which is of novel construction, is especially desirable for series systems of arc lighting, and is designed to avoid sparking between contacts.

527,195. Alternating Current Motor. Carl Coerper, Cologne, Germany. Application filed May 15, 1894.

In the accompanying drawing *a* is an armature, which is made of a piece of sheet iron or of a number of sheet iron pieces, which are connected so as to form an armature having radial arms. The armature *a* is mounted on a rotary shaft *s*, which passes through its center. Two adjacent arms *b b* of the armature are always under the influence of opposite and alternating poles of the field magnets *d' d'*. As soon as the armature is rotated at synchronous speed with the generator, it exerts considerable tractive force, and keeps up a speed corresponding exactly with the alternating changes of the current. Four pole faces are formed, and all the radial arms of the armature are simultaneously subjected to the influence of the alternately changing polarities of the pole faces. The form of the armature, as well as the form of the field magnets, has to be adapted for the purposes for which the motor is to be used.

527,211. Electric Arc Lamp. Max Mayer, New York, N. Y. Application filed June 18, 1894.

In this improvement an inverted and suspended base is made use of, to which the upper end of a hanging glass or transparent inclosure is connected substantially air-tight, and the carbons approach each other in the form of an inverted pyramid, and the cores of the regulating magnets preferably pass through the inverted base, so as to act upon the carbon holders in drawing the arc, but the helices of the electro-magnets are above the inverted base, so as to be easy of access, and also removed from the heat of the lamp, and in order to render the inclosure for the lamp substantially air-tight, the cores of the electro magnets slide in tubes that are closed at their upper ends, so as to exclude the atmosphere as well as protect the sliding cores from dust or other foreign substances that might obstruct the action of the electro-magnets.

527,214. Telephone Transmitter. Thomas McCoubray, New York, N. Y. Application filed August 16, 1894.

The invention is directed particularly to improvements in telephonic transmitters of the Hunnings type, in which carbon or equivalent comminuted material is used, and it has for its objects first, the prevention as far as possible of the packing of the powder when in use; second, the accurate adjustment of the parts for the purpose of obtaining the best possible effects.

527,225. Adjuster for Field Magnets of Dynamo-electric Machines or Motors. Montgomery Waddell, Bridgeport, Conn. Application filed September 26, 1893.

The invention relates to dynamo-electric machines and motors, and has for its object to provide a means for adjusting the magnets to compensate for the slight change of position of the armature, due to the wear of the bearings and kindred causes.

527,228. Electric Arc Lamp. John E. Woolverton, New York, N. Y. Application filed February 9, 1894.

The invention is made with reference to avoiding a shadow, and the inventor makes use of four carbons placed at a inclination to each other and coming to a focus or inverted apex, thereby entirely avoiding the casting of a shadow downwardly, and he combines with the carbons, their holders, sockets and lazy tongs, a main electro-magnet and a shunt magnet that act upon one or both pairs of carbons to separate them more or less in drawing the electric arc, one or both bases to which the pairs of carbons are permanently connected being hinged so as to allow for the aforesaid movement being given with but little friction or power in the regulation of the arc.

527,229. Electric Arc Lamp. John E. Woolverton, New York, N. Y. Application filed April 13, 1894.

In the present improvements the carbons are brought together in the form of a pyramid and separated by the action of the current passing through an electro-magnet, and the present invention relates to peculiar features of construction, whereby the lamp is rendered compact and facility given for the insertion of the carbons and for maintaining the proper relative position of such carbons by a simple mechanism that is not liable to become obstructed by friction or the presence of dust or any foreign substances.

527,244. Electric Locomotion on Railways. Jean J. Heilmann, Paris, France. Application filed April 20, 1894.

The object of this invention is to permit the engine to work with a constant cut-off, and consequently always under the most favorable conditions, or in other words so that the work done is always proportional to the speed of the engine, irrespective of the speed of the electro-locomotive and its train. In the accompanying illustration *C* is the generating dynamo and *E* its exciting machine. The current from the exciter passes through the rheostat *R* and the ammeter *a* on its way to the generator field magnet coils. *r* is the regulating rheostat of the exciting machine, *v* the voltmeter of this machine, and *V* the voltmeter of the generating dynamo. *A* is the principal ammeter, and *A'* to *A⁸* ammeters in the separate motor circuits. *I'* to *I⁸* are switches in the separate motor circuits. *C* is a commutator which is arranged to reverse the electro-motors by inverting the connections of the motor magnet coils *b'* to *b⁸* with regard to their armatures *K'* to *K⁸*. When the generating dynamo is employed as a motor to start its driving engine *D* from a dead center, the exciting machine being driven by its separate engine *D'*, the current from the exciter is passed temporarily into the generator armature by means of the switch *I*.

527,254. Insulator. William D. Trimble, Baltimore, Md. Application filed February 2, 1894.

An insulating cleat for suspending electric wires is described, comprising an upper piece, having a socket closed on all vertical sides and open on the bottom and provided with notches in its side flanges and a clamping piece provided with notches and fitting up within the socket, so that the latter projects down around it on all sides.

527,257. Electrical Signal. Harry H. Wister, Colorado City, Colo. Application filed April 10, 1893.

The object of the invention is to provide a signal which will apprise the engineer or other person on a train of the approach of another train on the same track, either from the front or rear, and also notify the engineer of a destroyed bridge, or a cave-in of a tunnel, or falling of a rock, or other obstruction on the track, or open switch.

527,258. Signal Recording Device. William H. Adkins, Rome, Ga. Application filed December 29, 1893.

The invention relates to an improved electric register and more especially to that class of signaling systems employing a central office or station and a number of signaling stations electrically connected to the central station, at which latter station the signals sent in from the signal stations are automatically recorded.

527,265. Conduit System for Electric Railways. William A. Butler, New York, N. Y. Application filed April 20, 1894.

In this system the contact boxes may be located in the conduit in such a way that the under face of the shoe or brush carried by the car will form contact with the conducting part of the outer shell, and cause the required movement thereof, or the boxes may be arranged within the conduit in any of the ways or according to any of the systems well known in the art and to which they are applicable.

527,267. System of Electric Block Signals for Railways. William M. Cuthbert, Brooklyn, N. Y. Application filed February 16, 1893.

The inventor, who has filed a patent, in which there are fifteen claims, divides a railroad into a number of longitudinal sections, each section being provided with, and represented by an office, and also subdivides the sections into blocks, each block being provided with and represented by a signal post, the posts being electrically connected the one with the other by an open circuit of high electromotive force, and with the office by a closed circuit of low electromotive force, also having in mechanical connection a device for setting a signal in the cab of a passing locomotive, this device being stationed in advance of the post and actuated simultaneously with, and by the changing of, the signal at the post, a signal in the cab of a locomotive having means of connection with a signal setting device, whereby the cab signal is set to indicate danger if the next block is closed (occupied), the posts also automatically telegraphing the section office of the passage of trains, number of cars in the train and the condition of the several blocks in the section.

527,285. Incandescent Lamp Socket. Luke R. Peck, St. Johns, Mich. Application filed April 10, 1894.

The invention consists in the peculiar construction of a lamp socket; first in the construction of the switch block or body, having a wall or diaphragm, upon opposite sides of which the terminals are adapted to be secured, so that in working about the socket, inserting the binding screws, etc., with tools or other metal instruments the short circuiting of the current is prevented; and second, in arranging on this switch block or body, fusible strips forming a part of the circuit, whereby the short-circuiting of the current will burn out but a single lamp.

527,294. Track Switch for Electric Railways. Augustin F. Schinner, Milwaukee, Wis. Application filed June 16, 1894.

The object of the invention is to provide, in combination with switch operating mechanism which is actuated by the core of the magnets, a single insulated strip in the wire, completing the circuit of the magnets, and which shall serve, when contact is made therewith by the trolley of one car, to throw the switch point in one direction, and when contact is made therewith by the trolley of the succeeding car, to throw the switch point in the opposite direction.

527,298. Electric Battery. Milton E. Smith and Maurice F. Geer, Rochester, N. Y. Application filed March 29, 1894.

An electric battery, comprising a jar, a negative electrode extending into a suitable fluid contained in the jar, a porous cup held in the jar and extending into the fluid, a positive electrode held in the porous cup, and an exciting fluid in the porous cup, this fluid containing chromic acid, is described.

527,301. Conduit Electric Railway. James E. Toole, Northumberland, Pa. Application filed January 24, 1894.

The object of the invention is to produce a very simple and inexpensive conduit electric railway in which the conduit is exceptionally strong as well as cheap, which has perfect means for draining the conduit, and which is provided with a trolley hung in such a manner that it may pass easily around curves, which has means for guiding the trolley wheel on the line wire, and which has means for conveniently raising the trolley whenever it is desired to break the circuit.

527,304. Workman's Time Recorder. Edward G. Watkins, Gardner, Mass. Application filed July 22, 1893.

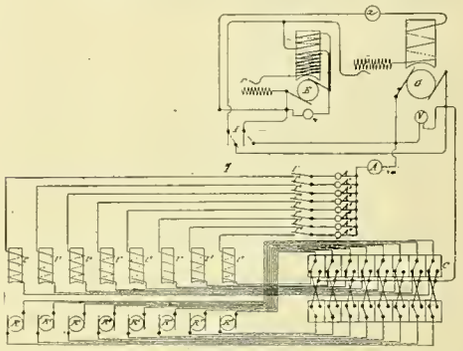
There is claimed in part in a time recorder, the combination with the case, a rotatable cylinder adapted to carry the time sheet and parallel pivoted marking levers, of two links pivoted to the case, a rod having its respective ends connected with the free ends of the links, the rod being arranged in the path of travel of the marking levers and essentially perpendicular thereto, a bell, and an operative connection between the rod and the bell.

527,317. Insulator. Edward J. Bullock, Wallingford, Conn. Application filed November 27, 1893.

The invention consists of an insulator having an inverted cup-shaped body constructed with a hub, which is adapted to have its base encircled by the wire, and a removable head applied to the hub, and constructed to overhang the base thereof by being made of larger external diameter than the same.

527,318. Insulator Pin. Edward J. Bullock, Wallingford, Conn. Application filed February 9, 1894.

The invention consists of an insulator pin for electric wires, having a long longitudinal bore formed in it, a metal reinforce located within the bore but shorter than the length of the same, and a plug fitted tightly into the open end of the bore over the outer end of the reinforce and sealing the same within the pin.



NO. 527,244.

527,355. Trolley Wire Support or Hanger. S. C. Woodhead, Philadelphia, Pa. Application filed April 24, 1894.

The object of the invention is to provide a device which can be attached to a separate and distinct wire, having no electric connections, and which will have one of its arms extending beneath the trolley wire at all times and thereby preventing the trolley falling to the ground.

527,375. Thermostat. Lewis G. Rowland, Camden, N. J. Application filed June 5, 1893.

One of the features of the invention is that the inventor proposes to arrange the body of the thermostat within the wall or ceiling in such manner that the cap or head only will be visible, and this cap or head may be ornamented in any desired manner or may be sunk flush with the line of the wall and colored in the same manner as the wall itself.

527,377. Apparatus for Mounting and Operating Thermopiles. Melvin L. Severy, Boston, Mass. Application filed February 16, 1894.

This invention relates to devices for the production of electricity by the action of solar heat upon a thermopile and has for its object the constant production of an electric current during the apparent diurnal and annual movements of the sun, without the necessity of moving the thermopile in accordance with the apparent movements of the sun.

527,378. Apparatus for Utilizing Steam for Heating Thermopiles. Melvin L. Severy, Boston, Mass. Application filed February 16, 1894.

The object of this invention is the utilization of the heat of the exhaust steam of an engine for the production of electricity and to heat the feed water for the boiler, and to this end the invention consists mainly in the combination with a steam boiler and engine of a thermopile, one face of which is heated by the exhaust steam and the other face cooled by the feed water supply.

527,379. Apparatus for Generating Electricity by Solar Heat. Melvin L. Severy, Boston, Mass. Application filed February 16, 1894.

One of the claims is for the combination of a thermo-electric pile, a case containing it having its side opposite the face of the pile composed of some material which is transparent to the rays of the sun, but opaque to dark radiated heat, a space between the front wall and the face of the pile, mechanism for moving the pile in accordance with the apparent annual and diurnal movements of the sun, a space between the back wall of the case and the back of the pile, two pipes communicating at one end with this space and at the other with a source of water under pressure, whereby a current of water is caused to flow through the last mentioned space.

527,393. Busy Test for Multiple Switchboards. Robert H. Polk, Savannah, Ga. Application filed April 20, 1894.

There is described in a busy test for multiple switchboards a high tension current source, a connecting loop, and a condenser of such capacity that the talking current will not pass through it, interposed in the wire connecting the source and loop, and a test-plug circuit.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE

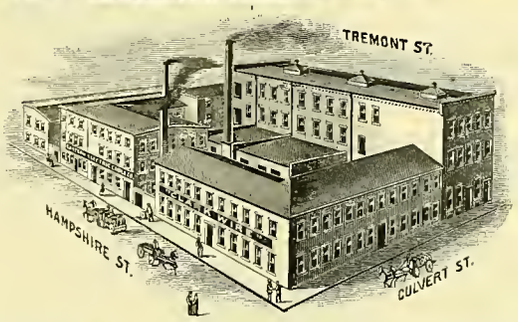
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickmon, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|

THE CHLORIDE ELECTRICAL STORAGE SYNDICATE, Limited, LONDON, ENGLAND.
SOCIETE ANONYME LE TRAVAIL ELECTRIQUE DES METAUX, PARIS, FRANCE.

**The Only Storage Battery in Use in Central Stations, of American Manufacture.**

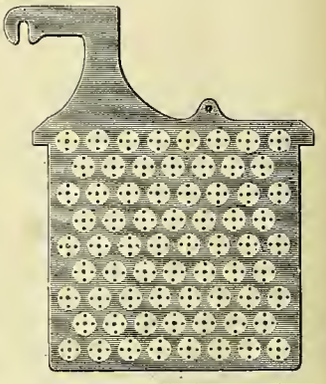
## The Electric Storage Battery Co.,

Drexel Building, PHILADELPHIA, PA.

TRADE MARK.

# Chloride Accumulator.

Registered September 11, 1894.

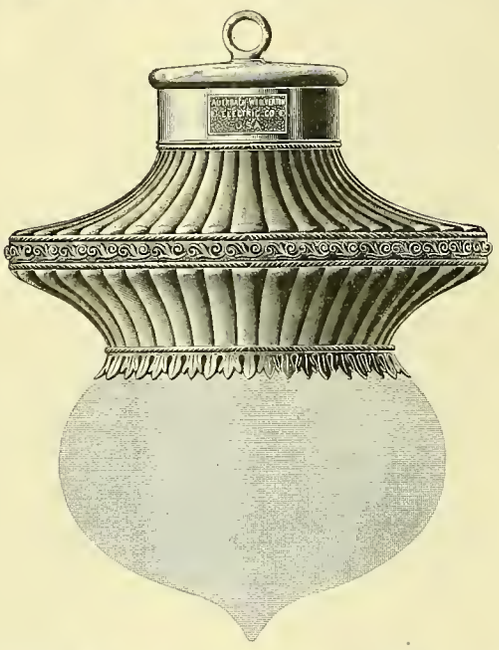


**Electrical Storage Cells of any desired capacity. Catalogues giving Capacities, Dimensions, Weights, Prices, etc., on application.**

---

# A BRAND NEW ARC LAMP.

# THE A.-W. ARC LAMP.



That burns on any current.

That measures 18 inches from top to bottom (including globe).

That has a life of 25 hours in the open air.

That throws light where you want it—on the ground.

That feeds neither by rack, clutch, clockwork, nor chain.

That casts no shadow whatever.

That gives the maximum light distribution.

That gives an absolutely steady light.

That keeps the arc stationary.

That feeds independent of the magnet.

**SIMPLICITY AND DURABILITY OF CONSTRUCTION.**

**THE MOST ORNAMENTAL LAMP IN THE MARKET.**

# AUERBACH-WOOLVERTON ELECTRIC CO.,

**Cable Building, Houston St. and Broadway, NEW YORK CITY.**

---

# R. D. NUTTALL COMPANY, Allegheny, Pa.

F. A. ESTEP.

# One of the pleasant reflections about Okonite

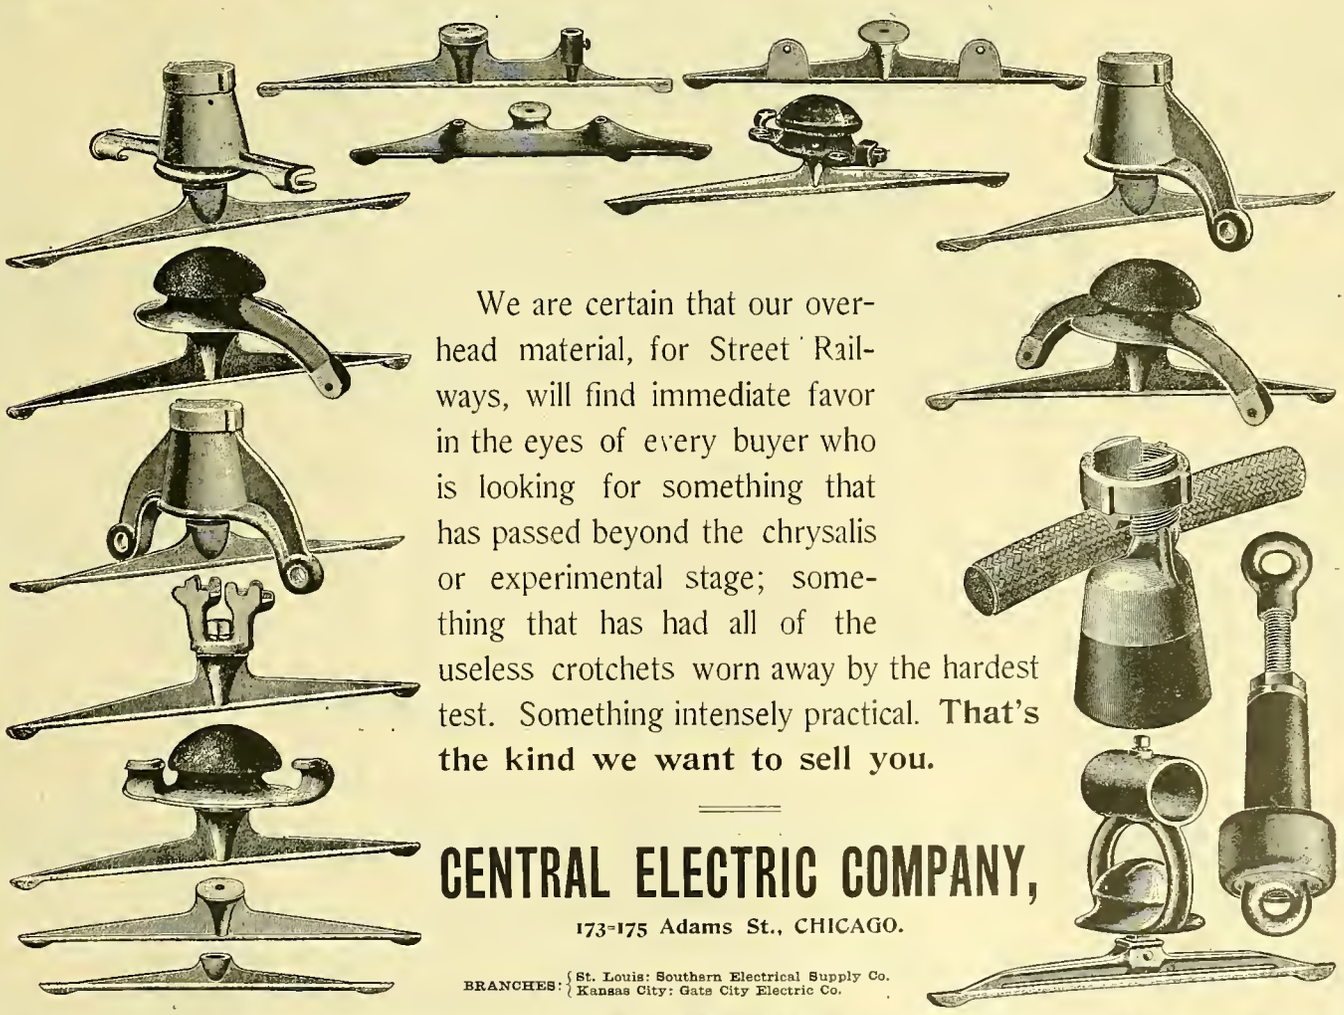
OKONITE TRADE MARK.

Is that inherent quality which places it on the very highest plane of broad popularity. Every one who has used Okonite for any purpose whatever, unites in the expression of opinion that

***It never disappoints.***

We do not believe that this can be predicated of any other insulated wire.

* * *



We are certain that our overhead material, for Street Railways, will find immediate favor in the eyes of every buyer who is looking for something that has passed beyond the chrysalis or experimental stage; something that has had all of the useless crotchets worn away by the hardest test. Something intensely practical. **That's the kind we want to sell you.**

## CENTRAL ELECTRIC COMPANY,

173-175 Adams St., CHICAGO.

BRANCHES: { St. Louis: Southern Electrical Supply Co.
Kansas City: Gate City Electric Co.

FRANK E. KIRBY, President. R. HUMFFREYS-ROBERTS, Secretary and Manager. RODOLPHUS FULLER, Electrical and Mechanical Engineer.

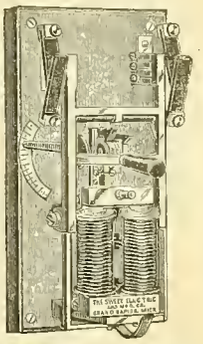
**Works and Main Office:**
**DETROIT, MICHIGAN.**

# How is This?



To the Greenville Oct 12th 1894
Sweet Electric & Mfg. Co.
Grand Rapids Mich.

Dear Sirs: We placed one of your alternating switches on our switch board and in less than ten hours it payed for itself. We got a dead short circuit on the commutator. The machine made one jump and the switch had done its work.

I fixed up the commutator and placed it back and it has run ever since.

The long and short of it is we saved an armature by having your switch on our board.

Very Truly Yours,
W. B. Serviss, Sup.
Greenville Electric Light Works,
Greenville Mich.

Do your armatures burn out? Of course they do, unless your plant is protected by one of our

## AUTOMATIC LIMIT SWITCHES.

We afford protection to any machine generating or using electric current.

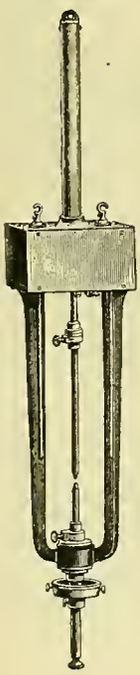
---

You thought we could not break the alternating current, but you see we can.

Write to

**SWEET ELECTRIC AND MFG. CO.**
**Grand Rapids, Mich.**

---



# STANDARD "WARD" LAMPS

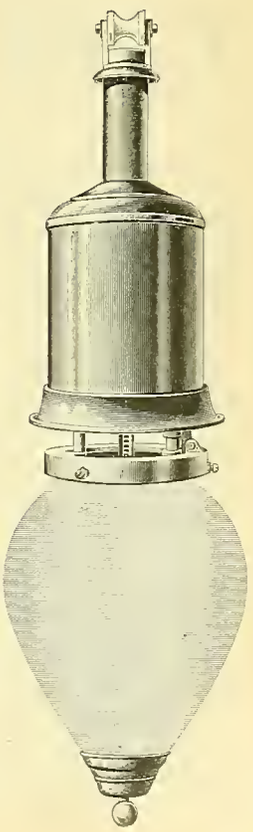
**For Direct Current, 110 Volts.**

## TEN DOLLARS EACH

**With Globe and Resistance, $2.00 Extra.**

**There are more lamps of the above type in use in the United States on Incandescent Circuits, than all other makes combined.**

## Send in Your Orders Quickly!



### ALTERNATING LAMPS.

Our new Alternating Lamp is the most economical and surest feed lamp on the market, burning from secondary circuits of 33, 50 or 100 volts.

Simplicity and strength of construction are the strong points of our lamps, rendering them more durable and easier to maintain than any others.

Lamps ENTIRELY WATERPROOF, dispensing with the use of hoods.

Write us for description and circular.

## ELECTRIC CONSTRUCTION & SUPPLY CO.,

**Established 1881.** **18 Cortlandt Street, New York.**

THE

# "CLARK" WIRE.

TRADE MARK.

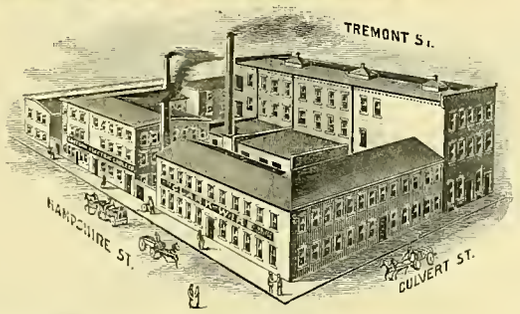
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Wes'ern Agents,

GREAT WESTERN MFG. CO.,

Chicago, Ill.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

### ASSIGNEE'S SALE.

## St. Paul and Minneapolis Messenger and Telephone Co.

**State of Minnesota, County of Ramsey—District Court, Second Judicial District.**

*In the matter of the assignment of the St. Paul and Minneapolis Messenger and Telephone Company.*

Notice is hereby given that the undersigned, the assignee for the St. Paul and Minneapolis Messenger and Telephone Company, a corporation, at his office in the Manhattan Building, in the City of St Paul, Minnesota, on the 14th day of November A. D. 1894, at 10 o'clock in the morning of said day will sell to the highest bidder for cash therefor, all the wire, messenger call boxes, batteries, office furniture and fixtures, and all book accounts due to said company. Said sale being made subject to approval by the District Court in and for the County of Ramsey, Minnesota.

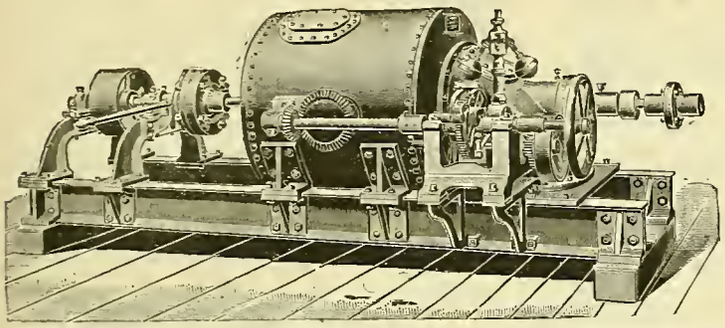
Notice is also given that the undersigned will apply to the District Court in and for the County of Ramsey, Minnesota, at a special term of said court, to be held in the City of St. Paul, Minnesota, on the 17th day of November, A. D. 1894, at 10 o'clock in the forenoon on said day or as soon thereafter as counsel can be heard, for an order confirming said sale.

Dated St. Paul, Minn., Oct 18, 1894.

ROBERT L. WINNE, Assignee.

A majority of the stock can be transferred at above sale. Plant is now in operation and so can be continued under one of the most valuable franchises in the City of St Paul.

# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**D'UNGER TELEPHONE.**

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.58 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195.19 | 82.68 |
| ¾ " | 16.78 | 117.33 | 112 60 | 175.74 | 82.18 |
| ⅝ " | 17.03 | 111.83 | 98.12 | 149.99 | 79.31 |
| ½ " | 16.88 | 118.67 | 82.07 | 118 40 | 75.52 |

Test of a 42-inch Wheel—July 14, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.33 | 128.00 | 134.18 | 199.56 | 80.50 |
| ⅞ " | 16.66 | 134.80 | 120.85 | 188,14 | 83.09 |
| ¾ " | 16.59 | 129.33 | 104.85 | 162.89 | 82.77 |

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

**THE JAMES LEFFEL & CO.** SPRINGFIELD, OHIO, AND NEW YORK CITY.

**Agents. $75** General or local Ladies or gents, a week Exclusive territory. **The Rapid Dish Washer.** Washes all the dishes for a family in one minute. Washes, rinses and dries them without wetting the hands. You push the button, the machine does the rest. Bright, polished dishes, and cheerful wives. No scalded fingers, no soiled hands or clothing. No broken dishes, no muss. Cheap, durable, warranted. Circulars free.

**W. P. HARRISON & CO.,** Clerk No. 12, Columbus, O.

# THE ALTERNATING CURRENT MOTOR PROBLEM SOLVED.

THE

# MONOCYCLIC SYSTEM,

## A COMPLETE CENTRAL STATION SYSTEM FOR SIMULTANEOUS LIGHT AND POWER.

**Incandescent Lamps, Arc Lamps and Motors**
**Operated from the same Generator**
**Economically and Efficiently.**

### CHARACTERISTICS OF THE MONOCYCLIC SYSTEM:

IT OPERATES LIGHTS and MOTORS, in parallel, ON THE SAME GENERATOR AND EVEN THE SAME TRANSFORMER.

IT SOLVES the HITHERTO UNSOLVED PROBLEM OF THE ALTERNATING CURRENT MOTOR. By the use of this system, alternating current motors may be operated which are not only EQUAL, BUT SUPERIOR to continuous current motors. They start under full load and even over load, have a CONSTANT SPEED, are EXTREMELY SIMPLE and ABSOLUTELY RELIABLE; and have neither COMMUTATOR, COLLECTOR RINGS, BRUSHES NOR MOVING WIRES.

LOW TENSION UNDERGROUND NETWORKS may be operated on the EDISON THREE WIRE SYSTEM and the LARGEST PART OF COPPER EXPENDED IN FEEDERS SAVED, as it is possible to use HIGH TENSION FEEDERS AND TRANSFORMERS. A BETTER BALANCE is secured and the NETWORK MAY BE EXTENDED UNLIMITEDLY.

It is as SIMPLE as the ORDINARY WELL-KNOWN ALTERNATING SYSTEM. It differs from it only in its ability to OPERATE HIGH GRADE MOTORS by means of a **THIRD OR POWER WIRE** which is carried only to the motors and resembles the *neutral wire* of the EDISON THREE WIRE SYSTEM.

It allows PERFECT OPERATION of the WHOLE SYSTEM of generators in parallel and thereby enables the WHOLE LIGHTING AND POWER STATION to be operated from THREE BUS-BARS ONLY, THE THIRD INTERMEDIATE BUS-BAR BEING FOR MOTOR SUPPLY.

It will operate, by the use of TWO TRANSFORMERS, THREE PHASE, QUARTER PHASE OR ANY OTHER TYPE OF ALTERNATING CURRENT MOTORS.

It gives a PERFECT REGULATION OF THE WHOLE SYSTEM, as all difficulties caused by SELF INDUCTION OR CAPACITY are eliminated. Current may be transmitted over any distance, in consequence of its low frequency—7,200 alternations.

It is operated with GENERATORS and TRANSFORMERS of an hitherto unattained EFFICIENCY and REGULATION.

THE GENERATORS AND MOTORS ARE BOTH SLOW SPEED.

# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

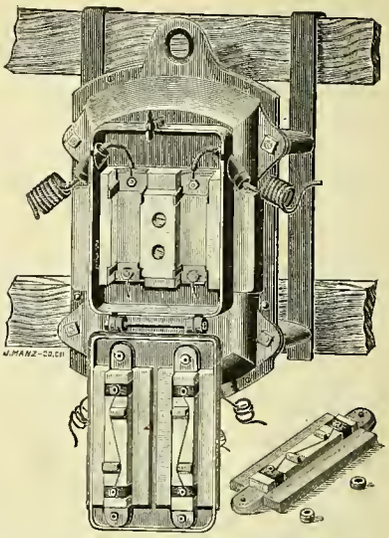
EASILY ADJUSTED. ABSOLUTELY RELIABLE.

# DIAMOND TRANSFORMER.

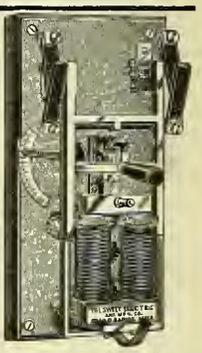
Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.



# How is This?



To the Greenville Oct 12th 1894
Sweet Electric & Mfg. Co.
Grand Rapids Mich.

Dear Sirs:—We placed one of your alternating switches on our switch board and in less than ten hours it payed for itself. We got a dead short circuit on the commutator. The machine made one jump and the switch had done its work. I fixed up the commutator and placed it back and it has run ever since.

The long and short of it is we saved an armature by having your switch on our board.

Very Truly Yours
W. B. Serviss Sup.
Greenville Electric Light Works
Greenville Mich.

Do your armatures burn out? Of course they do, unless your plant is protected by one of our

## AUTOMATIC LIMIT SWITCHES.

We afford protection to any machine generating or using electric current.

You thought we could not break the alternating current, but you see we can. Write to

## SWEET ELECTRIC AND MFG. CO.

**Grand Rapids, Mich.**

# R. D. NUTTALL COMPANY, Allegheny, Pa.

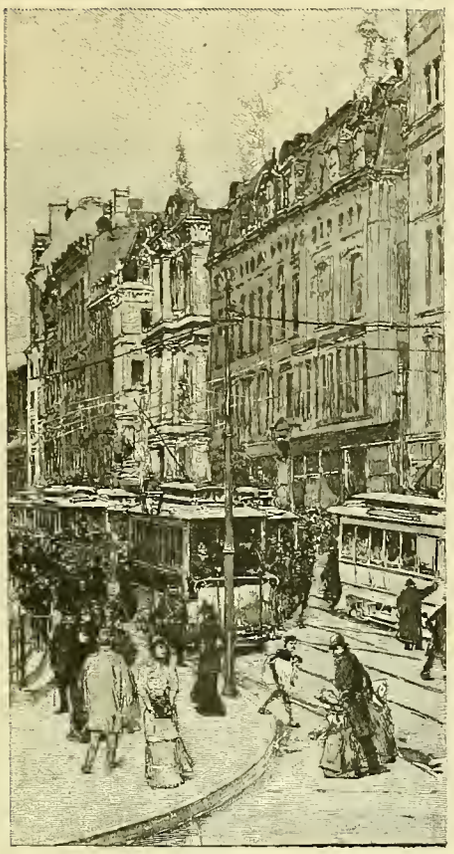
OKONITE
TRADE MARK.
Feed Wires.



# on a crowded thoroughfare

where travel is congested, where the clang of gongs din their warnings, and car-men have all they can do to watch incautious pedestrians, aiming to run as near schedule time as possible, what kind of overhead material, trolley wheels, bases, etc., would you recommend?

We hardly admit that the question is open to debate, the only answer we can think of is

**"the very best, gilt-edge, sensible fixtures made."**

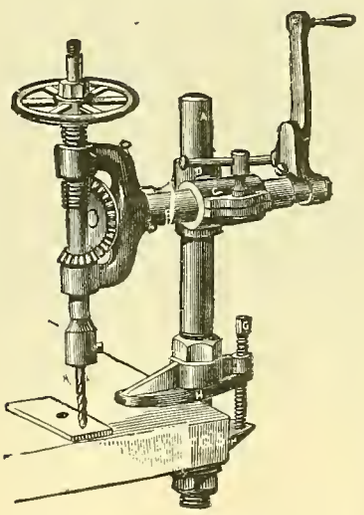
That's the kind we have to sell.

## Good material is cheaper than bad accidents.

(Paste this up for handy reference.)

Our stock of construction material, tools and general supplies for Street Railways, Central Stations and Isolated Plants we believe to be the largest and most complete in the United States. (We are not worrying about the other half of the world.)

**We will be pleased to give our best attention to your orders.**



## Central Electric Company,

**173-175 Adams Street.**

BRANCHES:

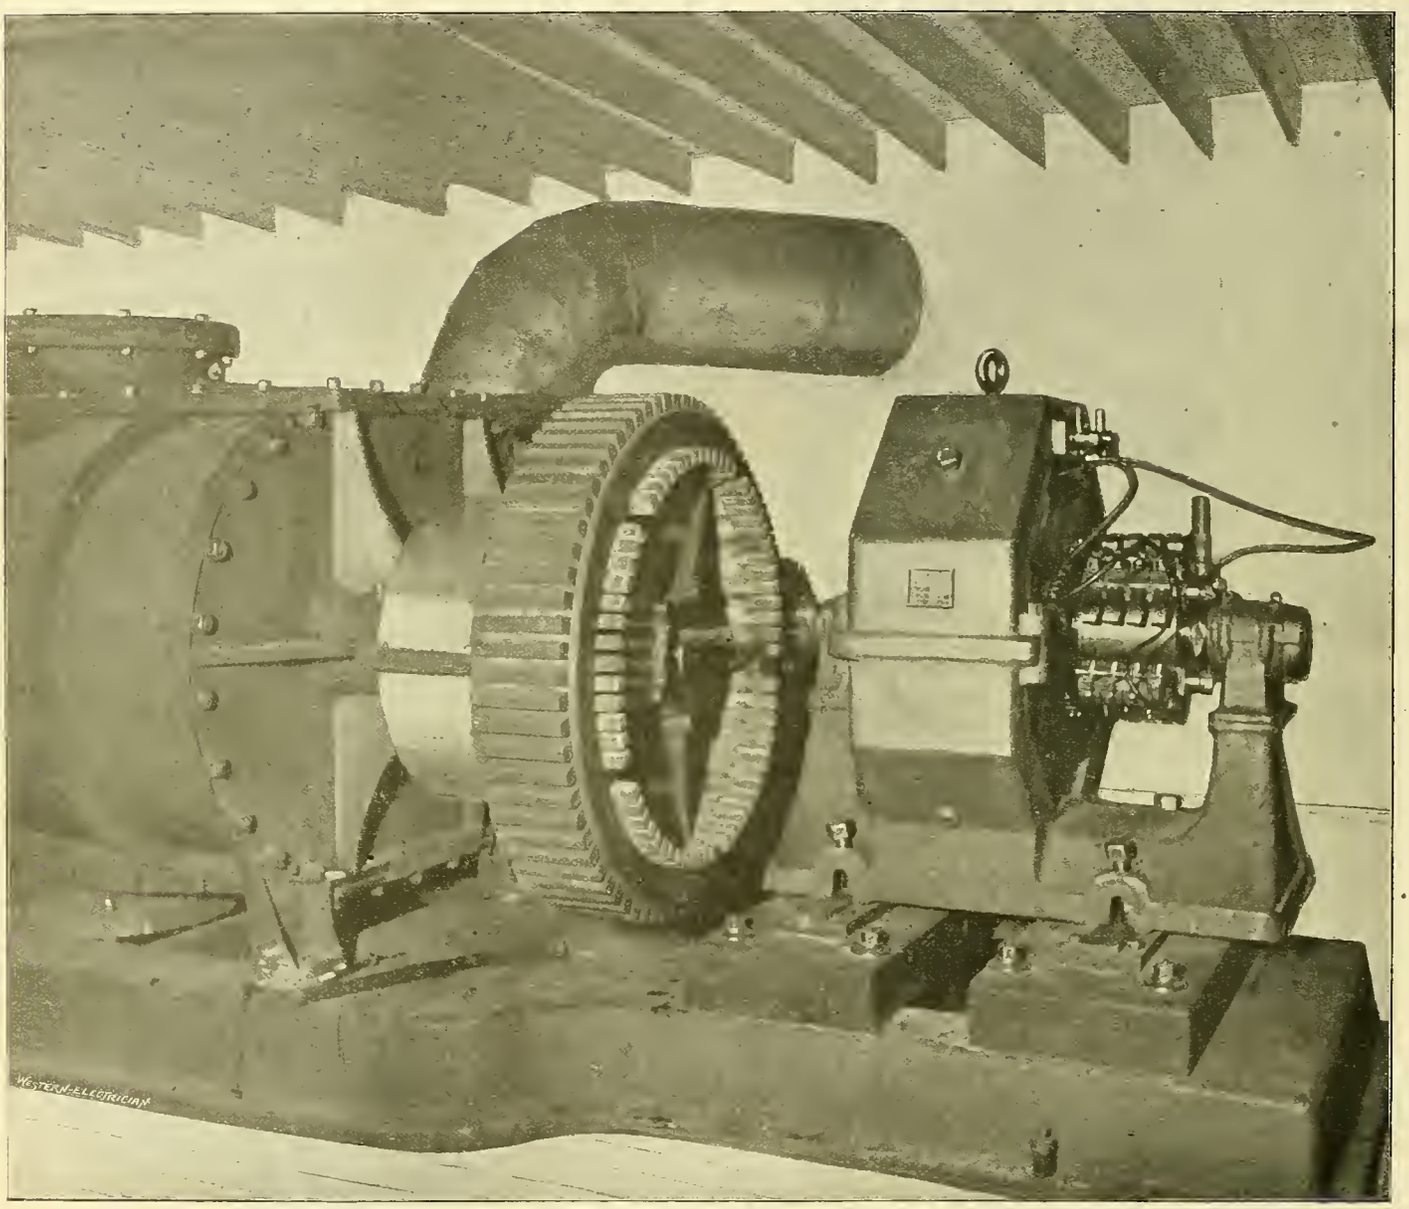
St. Louis; Southern Electrical Supply Co.
Kansas City; Gate City Electric Co.

GENERAL WESTERN AGENTS

Okonite Wires, Interior Conduit Supplies, Helios Arc Lamps, Washington Carbons, Carpenter Enamel Rheostats, Samson Batteries.

# WESTERN ELECTRIC CO.,

## CHICAGO,



WESTERN ELECTRIC MULTIPOLAR MOTOR GEARED DIRECTLY TO ROOT BLOWER.

MANUFACTURERS:

## Arc and Incandescent Electric Lighting Apparatus,

## POWER GENERATORS AND MOTORS,

(BIPOLAR, MEDIUM SPEED. MULTIPOLAR, SLOW SPEED.) Both Slow Speed and Medium Speed.

# A Brand New Arc Lamp.

# THE A.-W. ARC LAMP.

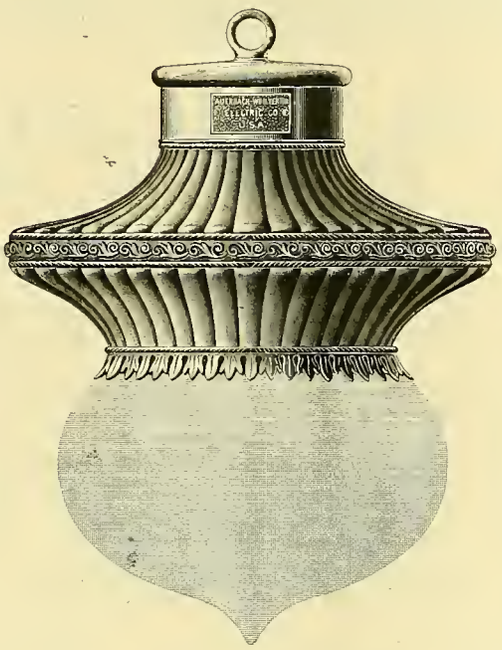
That burns on any current.

That measures 18 inches from top to bottom (including globe).

That has a life of 25 hours in the open air.

That throws light where you want it---on the ground.

That feeds neither by rack, clutch, clockwork, nor chain.



That casts no shadow whatever.

That gives the maximum light distribution.

That gives an absolutely steady light.

That keeps the arc stationary.

That feeds independent of the magnet.

## Simplicity and Durability of Construction.

THE

# "CLARK" WIRE.

TRADE MARK.

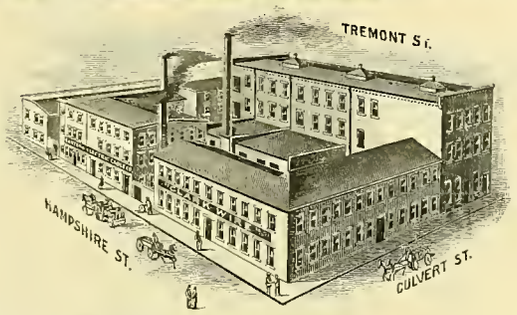
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**

**GREAT WESTERN MFG. CO.,**

**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

—— MANUFACTURERS OF ——

# DIRECT CURRENT MULTIPOLAR DYNAMOS AND GENERATORS.

These machines are constructed with outside revolving armatures, without and with special commutator, as desired. They have proved remarkably efficient and economical. Used largely in European Central Stations. They are slow-speed machines, made for direct connection to engine without belting, and in sizes from 20 H. P. to 1,500 H. P.

**HIGH-SPEED BELTED SIEMENS DYNAMOS**

Are copied extensively in this country as "Drum Type." We are building these machines in sizes from 1 H. P. to 150 H. P.

**ALTERNATING AND MULTIPHASE CURRENT DYNAMOS**

With laminated field and armature, in sizes from 1 H. P. to 4,000 H. P., for belted or direct coupling.

**MOTORS**

Of every speed for direct, alternating or multiphase current, in sizes from 1-10 H. P. up to 4,000 H P. Durable and economical in operation.

**SIEMENS BAND LAMPS**

For direct and alternating current, for constant potential and series machines.

**SIEMENS ARC LIGHT CARBONS**

With either solid or soft cores, which are the most economical in the world and give a steady light.

**ALL INSTRUMENTS**

Requisite for the regulation of electric apparatus; also the Siemens Voltmeters and Ammeters and Automatic devices made in Berlin.

## ASSIGNEE'S SALE.

## St. Paul and Minneapolis Messenger and Telephone Co.

**State of Minnesota, County of Ramsey—District Court, Second Judicial District.**

*In the matter of the assignment of the St. Paul and Minneapolis Messenger and Telephone Company.*

Notice is hereby given that the undersigned, the assignee for the St. Paul and Minneapolis Messenger and Telephone Company, a corporation, at his office in the Manhattan Building, in the City of St. Paul, Minnesota, on the 14th day of November, A. D. 1894, at 10 o'clock in the morning of said day, will sell to the highest bidder for cash therefor, all the wire, messenger call boxes, batteries, office furniture and fixtures, and all book accounts due to said company. Said sale being made subject to approval by the District Court in and for the County of Ramsey, Minnesota.

Notice is also given that the undersigned will apply to the District Court in and for the County of Ramsey, Minnesota, at a special term of said court, to be held in the City of St. Paul, Minnesota, on the 17th day of November, A. D. 1894, at 10 o'clock in the forenoon on said day or as soon thereafter as counsel can be heard, for an order confirming said sale.

Dated St. Paul, Minn., Oct. 18, 1894.

ROBERT L. WINNE, Assignee.

A majority of the stock can be transferred at above sale. Plant is now in operation and so can be continued under one of the most valuable franchises in the City of St. Paul.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

**NORTH STAR POINTS**

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 87 Clark Street.*

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

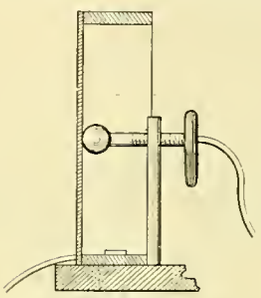

FIG. 44. BERLINER'S FIRST TRANSMITTER.

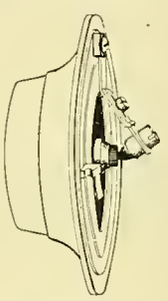

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45 inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.68 | 205.27 | 79 76 |

# THE STANLEY

## Two-Phase System of Alternating Apparatus,

***The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.***

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense in generators have been entirely eliminated from the Stanley; *i.e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

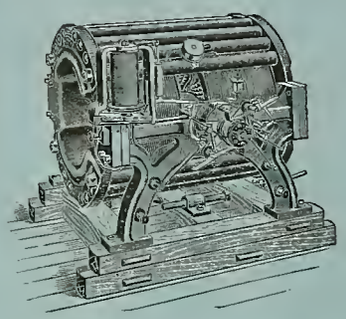
# ARC LIGHTING

—ON—

## CONSTANT CURRENT CIRCUITS.

(THOMSON-HOUSTON SYSTEM.)

THE REPUTATION OF THIS SYSTEM IS FULLY ESTABLISHED THROUGHOUT THE WORLD.

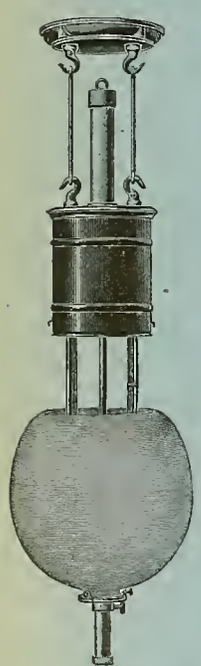


AS A SERIES SYSTEM OF ARC LIGHTING IT HAS NEVER BEEN SURPASSED. IT STANDS NOW AS EVER THE FIRST and FOREMOST.

—OR—

## CONSTANT POTENTIAL CIRCUITS.

INCANDESCENT, POWER, RAILWAY and ALTERNATING.



### THOMSON '93 ARC LAMP.

This most recent development in the Arc Lighting field has already proved that a really good thing is never neglected. The success of this lamp has been phenomenal, and it can now be found on incandescent circuits both direct and alternating, power and railway circuits, operating with absolute satisfaction.

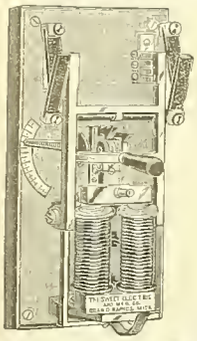
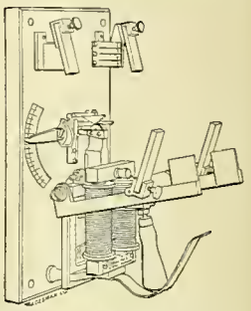
# HAVE PATIENCE!



We will answer every one who has written to us for information regarding our

## LIMIT SWITCH.



We knew that every one having electrical apparatus needed one or more of our Circuit Breakers, or we would not have started to manufacture them, but we did not anticipate the fact that there was the demand for them that there is. But electrical people are not slow to catch on to a good thing when they see it.

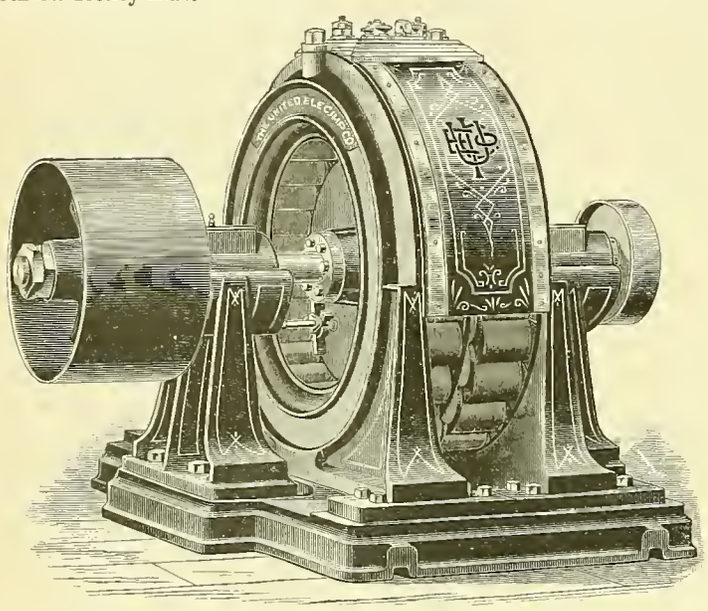
Write us and see what we can do for you.

## SWEET ELECTRIC & MFG. CO.,

GRAND RAPIDS, MICH.

## REMOVAL NOTICE!

The United Electric Improvement Co. have removed their office and works to new factory building, Allegheny Ave. and 19th St., Philadelphia, Pa. Convenient to Germantown Junction on Penna R. R., and Tioga Station on the Phila. & Reading R. R. Can also be reached by 13th St. Trolley Line.



Our increased facilities will enable us to carry in stock for prompt delivery Alternating Current Generators, Direct Current Apparatus for lighting and transmission of power, and Improved Long Distance Series Incandescent Apparatus; also a full line of Series Incandescent Lamps of improved manufacture.

Correspondence Solicited.

## The United Electric Improvement Co.,

Allegheny Ave. and 19th St., Philadelphia.

## ARC LAMPS FOR INCANDESCENT

Circuits, Both Alternating and Direct.

**Standard "Ward" Lamps, $10 Each**

TWO IN SERIES ON 110 VOLTS.

Globe and Resistance, $2.00 extra per lamp.

## A Complete Line

Of ENTIRELY NEW Arc Lamps.

SIMPLEST. STRONGEST. SUREST FEED.

Easiest and Cheapest to Maintain.

*SPECIAL LAMPS OF ALL KINDS.*

WRITE US FOR CIRCULARS.

We carry a stock of FIDELITY carbons and IMPORTED CORED carbons, which we are selling at reduced prices.

USERS OF ARC LAMPS SHOULD WRITE US FOR PRICES.

### THE RACE BETWEEN CHICAGO AND NEW YORK

The New York *World* is truthful and conscientious enough to admit that at last Chicago has beaten New York in the contest for first rank in voters and population. In other words, it admits that Chicago is the metropolis of the United States and that New York takes second place. After making the admission it tenders its congratulations in the following graceful fashion:

That Chicago has achieved this result by consolidating the territory and population that naturally belongs to it does not detract from its credit. That the greater Chicago is bigger than the smaller New York is a reflection upon our sagacity, public spirit, and enterprise, not a reflection upon the methods of the mighty metropolis of the West. Upon the basis of this year's registration the newspapers of Chicago claim a population of 2,175,732. This is indeed a marvelous showing. It is one of which all Americans have reason to be proud, even as they were proud of that greatest and most beautiful of Chicago's achievements, the White City of the World's Fair.

The only way out of this predicament is now being canvassed by the excited New-Yorkers. It contemplates the annexation of Brooklyn and other outlying areas. It is questionable, however, whether Brooklyn will be in a hurry to be absorbed by its neighbor across the big bridge. The Brooklynites know well enough that it would only put off the question of supremacy for a short time. They have no overweening desire to sacrifice themselves and lose their municipal identity for the glorification of New York. They know well enough it is useless to conceal the fact that Chicago is destined to be the London of America, of which New York will be the highly respectable Liverpool. New York will be the port for Chicago, and Chicago will be the great central point to which Denver, Pittsburg, St. Louis, Louisville, Cleveland, Minneapolis, St. Paul, and other feeders will send their goods for sale. The agricultural products of the great West must come here. Chicago will be the great manufacturing center, thus still further increasing its great population. Its factories and shops will be hives of industry, swarming with thousands of workingmen. It will be the great railroad center of the continent. As the most accessible point in the country thousands will be attracted here by the extraordinary inducements offered them. All these influences will tend not only to a phenomenal increase of population, but to a corresponding increase of wealth. Hence it must be the commercial, industrial, and financial center of America. The New-Yorkers feel this, but nothing can tempt them to admit it. The Brooklynites know it. Meanwhile Chicago is contented with the situation. It knows that it is today the metropolis of the United States, but it is not proud or vainglorious on that account, nor is it inclined to exalt itself at the expense of New York. It harbors no jealousies and cherishes no envy of the late metropolis. It even hopes that the New-Yorkers may annex all that they want, so that Chicago may have a good, fair and square race with that city. The outcome of such a race is inevitable.

### POPULIST CANDIDATES FOR CONGRESS.

Following are the names of the Populist candidates for Congress in this county, and ...e great question of protec-

**Doing business in the metropolis of the United States,** we are enabled to secure advantages for our customers in many ways not possible with establishments in smaller cities.

The railway and shipping facilities of Chicago are unsurpassed; all influences are in the direction of the rapid transaction of business.

Not alone in manufacturing and financial interests will Chicago lead, but also in the manufacture and distribution of Electrical Supplies. To this central point the great Electric Railway Systems of the country, the marvelous Power Plants, the thriving Central Stations in every city, village and hamlet, must look for their general supplies.

We congratulate ourselves that we are early in the field, that we are **already here.** We recognize the advantages under which we labor and we are ready to share with you.

**What we want is orders.**

---

This new Trolley Wire Clamp is made to fit either a $\frac{5}{8}$ in. or $\frac{7}{16}$ in. stud. We furnish them in bronze or malleable iron. They hold the wire with a grip that nothing in the way of a strain can loosen. They offer no obstruction to the passage of the wheel, hence no jumping or sparking. No bolts or screws.

## New Alternating Arc Lamp

### For Street Lighting

No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.

## *Low Potential Direct Current Lamps*

We have just completed a new direct current lamp which we guarantee will not **SEE-SAW.** The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.

No. 13.
Inside 7 Ampere 7 Hour Lamp.

### ASSIGNEE'S SALE.

### St. Paul and Minneapolis Messenger and Telephone Co.

**State of Minnesota, County of Ramsey—District Court, Second Judicial District.**

*In the matter of the assignment of the St. Paul and Minneapolis Messenger and Telephone Company.*

Notice is hereby given that the undersigned, the assignee for the St. Paul and Minneapolis Messenger and Telephone Company, a corporation, at his office in the Manhattan Building, in the City of St Paul, Minnesota, on the 14th day of November, A. D. 1894, at 10 o'clock in the morning of said day, will sell to the highest bidder for cash therefor, all the wire, messenger call boxes, batteries, office furniture and fixtures, and all book accounts due to said company. Said sale being made subject to approval by the District Court in and for the County of Ramsey, Minnesota.

Notice is also given that the undersigned will apply to the District Court in and for the County of Ramsey, Minnesota, at a special term of said court, to be held in the City of St. Paul, Minnesota, on the 17th day of November, A. D. 1894, at 10 o'clock in the forenoon on said day or as soon thereafter as counsel can be heard, for an order confirming said sale.

Dated St. Paul, Minn., Oct. 18, 1894.

ROBERT L. WINNE, Assignee.

A majority of the stock can be transferred at above sale. Plant is now in operation and so can be continued under one of the most valuable franchises in the City of St. Paul.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45 inch Wheel—July 9, 1894.**

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

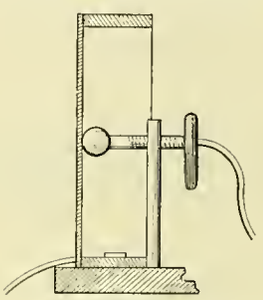

FIG. 44. BERLINER'S FIRST TRANSMITTER.

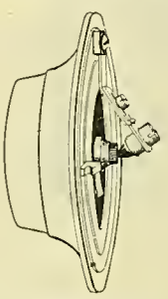

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

# Western Electrician

$3 per Annum. Copyright, 1894, by Electrician Publishing Company, Chicago. EVERY SATURDAY. Entered at Chicago Postoffice as mail matter of the second class. 10 cents per Copy.

Vol. XV. CHICAGO, NOVEMBER 17, 1894. No. 20

MASS. INSTITUTE OF TECHNOLOGY NOV 17 1894 LIBRARY

MASSACHUSETTS INSTITUTE OF TECHNOLOGY DEPARTMENT OF PHYSICS

**SIMPLEX** INSULATED WIRES AND CABLES.

RUBBER COVERED, WEATHERPROOF, UNDERGROUND and SUBMARINE.

WESTERN SELLING AGENTS: H. R. HIXSON, 1137 Monadnock Block, CHICAGO.

Simplex Electrical Company, 75-81 Cornhill, BOSTON, MASS.

**WHY NOT BUY FIRST-CLASS LAMPS**

At a fair price, rather than experiment with unknown and probably inferior goods? We are exclusive northwest agents for the **High-Grade Packard Lamp**, and can fill all orders promptly.

ELECTRICAL ENGINEERING CO., Minneapolis, Minn.

Manufactured by New York & Ohio Co., Warren, O.

**Pivotal Boston Trolleys,**
**Anderson Steel Trolley Poles,**
**West End Trolley Wheels,**
**Trolley Repair Parts**—All in Stock.

*Correspondence Solicited.*

Man'f'd by ALBERT & J. M. ANDERSON, 289 to 293 A St., Boston, Mass.

**ALFRED F. MOORE,**

MANUFACTURER OF

**INSULATED ELECTRIC WIRE,**

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

**PARTRIDGE** Send for Samples.

Sandusky, Ohio. **CARBON CO.**

**DRY BATTERIES.**

BEST OF ALL IS **THE STANDARD,**

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2¼, 60 cts. per cell. LIBERAL DISCOUNTS.

**Accumulator Company,**

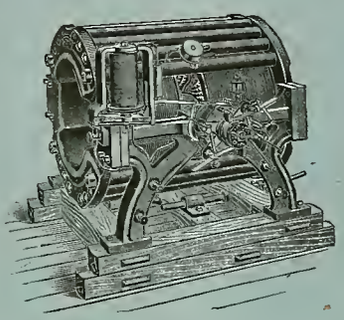
# ARC LIGHTING

—ON—

# CONSTANT CURRENT CIRCUITS.

**(THOMSON-HOUSTON SYSTEM.)**

**THE REPUTATION OF THIS SYSTEM IS FULLY ESTABLISHED THROUGHOUT THE WORLD.**

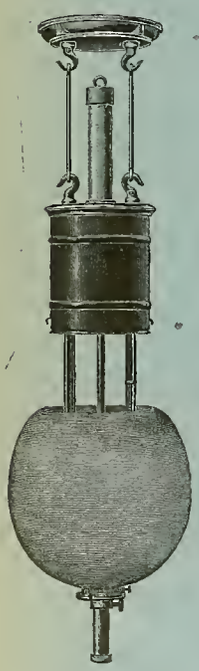


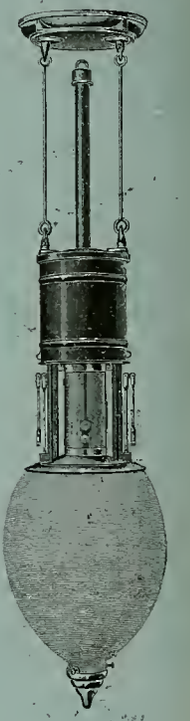
**AS A SERIES SYSTEM OF ARC LIGHTING IT HAS NEVER BEEN SURPASSED. IT STANDS NOW AS EVER THE FIRST and FOREMOST.**

—OR—

# CONSTANT POTENTIAL CIRCUITS.

**INCANDESCENT, POWER, RAILWAY and ALTERNATING.**





## THOMSON '93 ARC LAMP.

This most recent development in the Arc Lighting field has already proved that a really good thing is never neglected. The success of this lamp has been phenomenal, and it can now be found on incandescent circuits both direct and alternating, power and railway circuits, operating with absolute satisfaction.

**WRITE FOR OUR ILLUSTRATED CATALOGUES.**

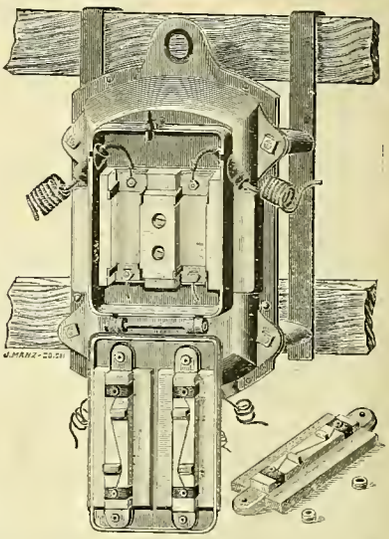
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

# THE STANLEY

## Two-Phase System of Alternating Apparatus,

***The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.***

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense in generators have been entirely eliminated from the Stanley; *i.e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

# A BRAND NEW ARC LAMP.

# THE A.-W. ARC LAMP.

That burns on any current.

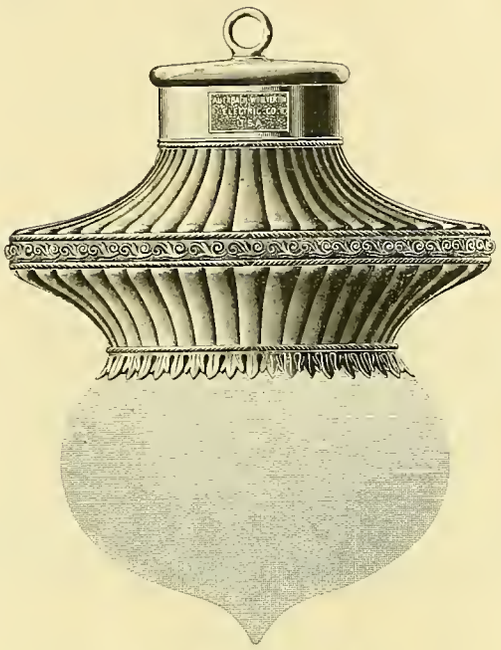
That measures 18 inches from top to bottom (including globe).

That has a life of 25 hours in the open air.

That throws light where you want it—on the ground.

That feeds neither by rack, clutch, clockwork, nor chain.

That casts no shadow whatever.



That gives the maximum light distribution.

That gives an absolutely steady light.

That keeps the arc stationary.

That feeds independent of the magnet.

**SIMPLICITY AND DURABILITY OF CONSTRUCTION.**

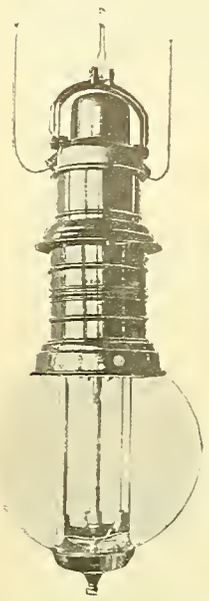
## New Alternating Arc Lamp

### For Street Lighting



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.

## *Low Potential Direct Current Lamps*

We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.

THE

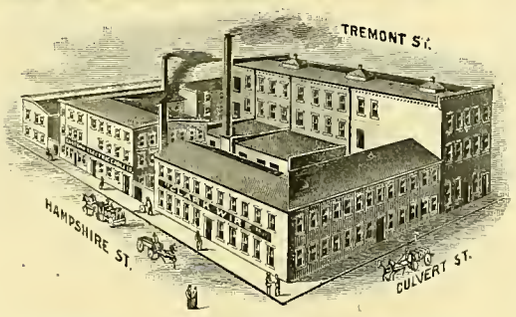
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalognee with Terms and Discounts for Quantities.

ASSIGNEE'S SALE.

## St. Paul and Minneapolis Messenger and Telephone Co.

**State of Minnesota, County of Ramsey—District Court, Second Judicial District.**

*In the matter of the assignment of the St. Paul and Minneapolis Messenger and Telephone Company.*

Notice is hereby given that the undersigned, the assignee for the St. Paul and Minneapolis Messenger and Telephone Company, a corporation, at his office in the Manhattan Building, in the City of St. Paul, Minnesota, on the 14th day of November, A. D. 1894, at 10 o'clock in the morning of said day, will sell to the highest bidder for cash therefor, all the wire, messenger call boxes, batteries, office furniture and fixtures, and all book accounts due to said company. Said sale being made subject to approval by the District Court in and for the County of Ramsey, Minnesota.

Notice is also given that the undersigned will apply to the District Court in and for the County of Ramsey, Minnesota, at a special term of said court, to be held in the City of St. Paul, Minnesota, on the 17th day of November, A. D. 1894, at 10 o'clock in the forenoon on said day or as soon thereafter as counsel can be heard, for an order confirming said sale.

Dated St. Paul, Minn., Oct. 18, 1894.

ROBERT L. WINNE, Assignee.

A majority of the stock can be transferred at above sale. Plant is now in operation and so can be continued under one of the most valuable franchises in the City of St. Paul.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill

**NORTH STAR POINTS**

is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling *"Where the Trout Hide"* will be sent free upon application to Geo. H. Heafford, General Passenger Agent. "North Star Route." Chicago, Ill

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth, 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

### PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16 ...Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

### PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

### PART III.—Miscellaneous Inventions and Writings.

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

### PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

**This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by**

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickmen, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

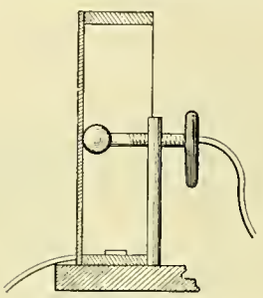

FIG. 44. BERLINER'S FIRST TRANSMITTER.

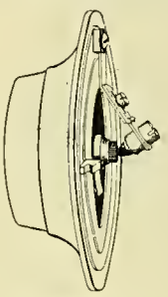

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

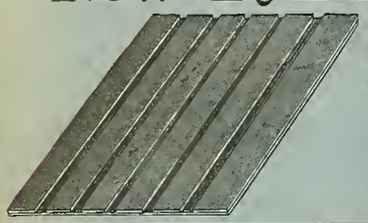
Manufactured by

American Electric Mfg. Co.

WRITE FOR REDUCED PRICES.

2009 to 2017 Pine St., St. Louis, Mo.

## New Dynamo Belting.



Patent Grooved Belting having Grooves running lengthwise of the Belt, serve as channels to permit the escape of air between Belt and Pulleys, to such a degree that the air cushion is overcome and the Belt can be run very slack, thereby taking the heavy strain from the bearings.

SHULTZ BELTING CO., St. Louis, Mo.

Agents in all Principal Cities.

BRANCHES:
164 Summer Street, Boston.
225 Pearl Street, New York.
129 North 3d Street, Philadelphia.

BOLGIANO'S

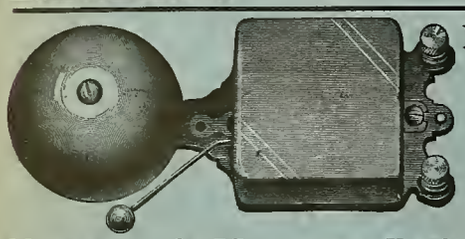
## Electric Fan Water Motor.

Current free as it connects with any faucet. Sample $6.00. Wholesale and retail.

The Bolgiano Mfg. Co.,
415 Water St.,
BALTIMORE, MD.

## Storage Batteries

FOR ALL PURPOSES.
Bradbury-Stone Electric Storage Co.,
LOWELL, Mass.



## BELLS,

# AFFIRMATION!

ANOTHER

# IMPORTANT DECISION!

A decision was handed down on November 15th, in the United States Court of Appeals for the Second Circuit, in the case of the Accumulator Company against the Edison Electric Illuminating Company and the Electric Storage Battery Company by Judges Wallace, Shipman and Townsend, affirming the decision of Judge Lacombe enjoining the Edison Electric Illuminating Company of New York from using the chloride battery, on the ground that it is an infringement of the Swan reissue patent.

## New Alternating Arc Lamp

### For Street Lighting

No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.

## *Low Potential Direct Current Lamps*

We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.

Write us for Prices and Discounts

Absolutely Dry Steam

Safety and Economy

14 & 16 Church St. cor. Cortlandt · New York.

STRATTON

## Miamisburg Electric Co., - Miamisburg, Ohio.

### IMPERIAL DRY BATTERY.

Guaranteed the best Dry Battery ever made. Internal short circuiting or local action is eliminated. Will not deteriorate when not doing work. Will hold its first value over long periods of time. Internal resistance small; high and constant E. M. F. Will not run down or die on the shelf. No bursting of seals or oozing of salts from the top.

### Burnley Cartridge Battery.

Cartridge or Porous Cups made of especially prepared paper. One-half the size and one-third the weight of other porous cups. Guaranteed to be equal to any Salammoniac battery made. The cheapest battery now on the market.

### TEMPERED COPPER.

All patterns of tempered copper segments guaranteed true to gauge, free from defects; no alloy; finish and temper equaled by none. Exclusively used by some of the largest companies in the country.

All Batteries Guaranteed. Send for Catalogue

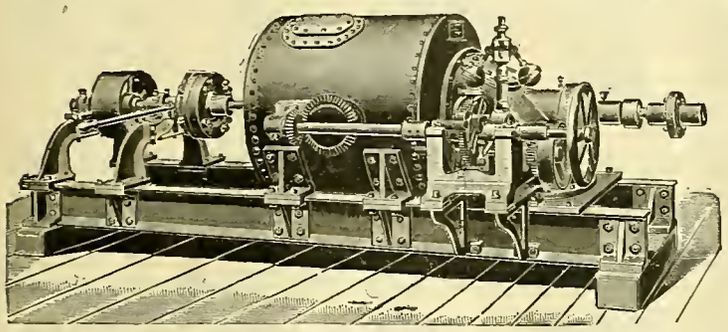
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter,** being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

**D'UNGER TELEPHONE.**

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner. — The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric-current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'UNGER,** Manager, Palmer House, Chicago, Ill.

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

## WESTERN ELECTRIC CO., CHICAGO.

# "IT GIVES SATISFACTION."

How do you know? EVERYBODY that has used it tell us so and we believe *them*. N. I. R. Wire has been used in the City of Chicago in a majority of the largest buildings that have lately been constructed, and has been subjected to the severest tests. Among the most notable buildings, we are pleased to mention the "Ryerson Laboratory," "New York Life Building," "Medinah Temple," "Y. M. C. A.," "Elevated Railroad Stations," and many of the large packing houses, and numerous other buildings equally as important. **One Contractor alone has used over one million feet.** N. I. R. Seamless Insulation has very high insulating qualities, and is less susceptible to destructive influences of heat, cold, moisture and gases than other insulation. FINE PARA RUBBER only is used, and the SEAMLESS INSULATION is superior to any having seams. THE NATIONAL INDIA RUBBER COMPANY employs only skilled workmen and has had over 30 years experience in the manipulation of India Rubber. As General Western Agents, we carry a large stock on hand and are always ready to execute any size orders with dispatch. Send us a trial order.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

# Alternating Currents.

**An Analytical and Graphical Treatment for Students and Engineers.**

BY FREDERICK BEDELL, PH.D.,

AND

A. C. CREHORE, PH.D.

**Cloth, 325 pages, 112 illustrations, Price, $2.50.**

The present work is the first book that treats the subject of alternating currents in a connected, logical, and complete manner. The principles are gradually and logically developed from the elementary experiments upon which they are based, and in a manner so clear and simple as to make the book easily read by any one having even a limited knowledge of the mathematics involved. By this method the student becomes familiar with every step of the proces of development, and the mysteries usually associated with the theory of alternating currents are found to be rather the result of unsatisfactory treatment than due to any inherent difficulty. The first fourteen chapters contain the analytical development, commencing with circuits containing resistance and self-induction only, resistance and capacity only, and proceeding to more complex circuits containing resistance, self-induction, and capacity, and resistance and distributed capacity. A feature is the numerical calculations given as illustrations. The remaining chapters are devoted to the graphical consideration of the same subjects, enabling a reader with little mathematical knowledge to follow the authors, and with extensions to cases that are better treated by the graphical than by the analytical method.

CONTENTS.

**Part I. Analytical Treatment.**—Chapter I. Introductory to Circuits containing Resistance and Self-induction.—Chapter II. On Harmonic Functions.—Chapter III. Circuits Containing Resistance and Self-induction.—Chapter IV. Introductory to Circuits Containing Resistance and Capacity.—Chapter V. Circuits Containing Resistance and Capacity.—Chapters VI, VII, VIII, IX, X, XI. Circuits Containing Resistance, Self-induction, and Capacity.—Chapters XII, XIII. Circuits Containing Distributed Capacity and Self-induction.

**Part II. Graphical Treatment.**—Chapters XIV, XV, XVI, XVII. Circuits Containing Resistance and Self-induction.—Chapter XVIII, XIX. Circuits Containing Resistance and Capacity.—Chapter XX. Circuits Containing Resistance, Self-induction, and Capacity.

**Appendix A.** Relation between Practical and C. G. S. Limits.—Appendix B. Some Mechanical and Electrical Analogies.—Appendix C. System of Notation Adopted.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbangh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

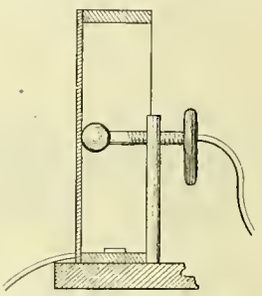

FIG. 44. BERLINER'S FIRST TRANSMITTER.

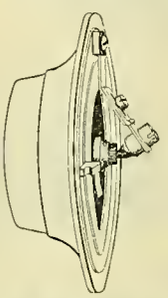

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

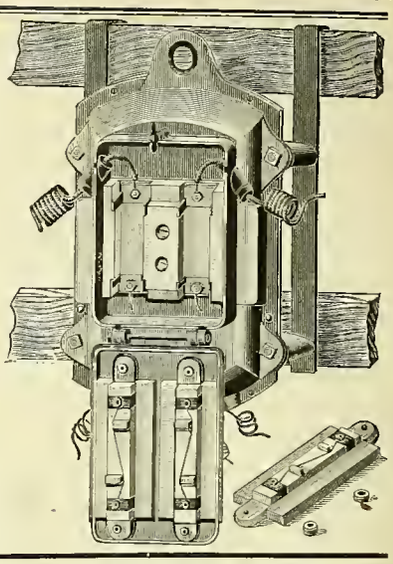
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

# THE STANLEY

## Two-Phase System of Alternating Apparatus,

***The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.***

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense in generators have been entirely eliminated from the Stanley; *i.e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

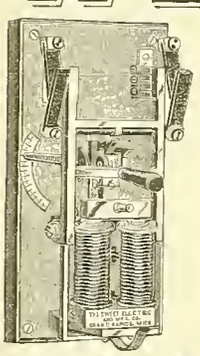
Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

## STANLEY ELECTRIC MFG. CO., PITTSFIELD, MASS.

**Western Office, 307 Dearborn Street, Chicago, Ill.**

# WIND AND SLEET.

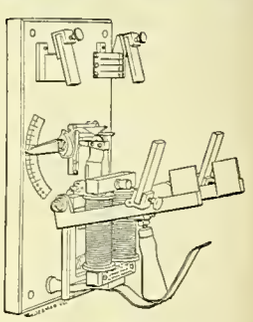


It is out of season for lightning, but you have to be protected from short circuits caused by wind and sleet breaking down your wires, and having them crossed by wires carrying high tension currents.

## OUR SWITCHES FOR THE ALTERNATING CURRENT

continue to go like "hot cakes," and well they ought to, so much protection to life and property for so little outlay; you cannot afford to be without them.

With our device set at 100 amperes you have better protection to your electrical apparatus than from a 10 ampere fuse. Write us at once.



## SWEET ELECTRIC & MFG. CO.,

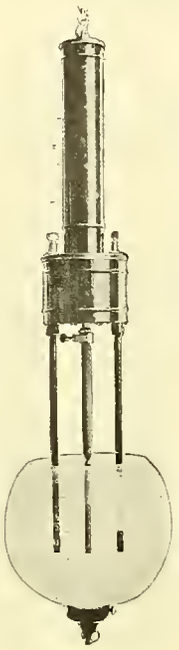
# THE HELIOS

## New Alternating Arc Lamp

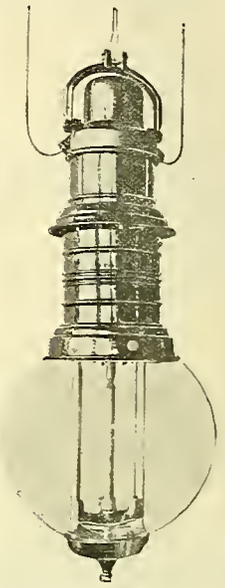
### For Street Lighting

No. 13.
Ioside 7 Ampere 7 Hour Lamp.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.



We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

*Low Potential*
*Direct Current Lamps*

THE
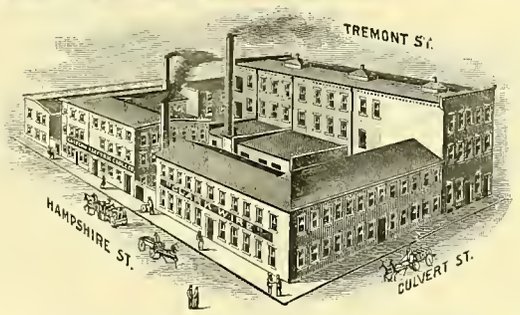
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired.**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

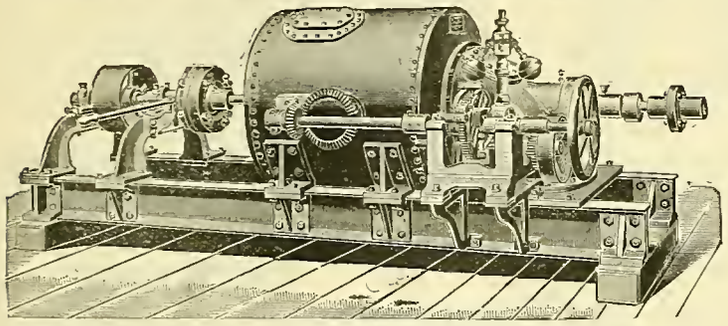
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Company has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger**, Manager, Palmer House, Chicago, Ill.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbangh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

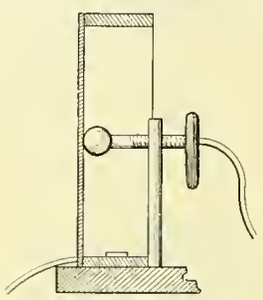

FIG. 44. BERLINER'S FIRST TRANSMITTER.

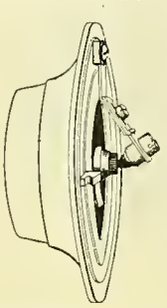

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 81 Clark Street.*

☞ Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

# WESTERN ELECTRIC CO., CHICAGO.

# "IT GIVES SATISFACTION."

How do you know? EVERYBODY that has used it tell us so and we believe *them.* N. I. R. Wire has been used in the City of Chicago in a majority of the largest buildings that have lately been constructed, and has been subjected to the severest tests. Among the most notable buildings, we are pleased to mention the "Ryerson Laboratory," "New York Life Building," "Medinah Temple," "Y. M. C. A.," "Elevated Railroad Stations," and many of the large packing houses, and numerous other buildings equally as important. **One Contractor alone has used over one million feet.** N. I. R. Seamless Insulation has very high insulating qualities, and is less susceptible to destructive influences of heat, cold, moisture and gases than other insulation. FINE PARA RUBBER only is used, and the SEAMLESS INSULATION is superior to any having seams. THE NATIONAL INDIA RUBBER COMPANY employs only skilled workmen and has had over 30 years experience in the manipulation of India Rubber. As General Western Agents, we carry a large stock on hand and are always ready to execute any size orders with dispatch. Send us a trial order.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

By FREDERICK BEDELL, Ph.D.,

AND

A. C. CREHORE, Ph.D.

**Cloth, 325 pages, 112 illustrations, Price, $2.50.**

The present work is the first book that treats the subject of alternating currents in a connected, logical, and complete manner. The principles are gradually and logically developed from the elementary experiments upon which they are based, and in a manner so clear and simple as to make the book easily read by any one having even a limited knowledge of the mathematics involved. By this method the student becomes familiar with every step of the process of development, and the mysteries usually associated with the theory of alternating currents are found to be rather the result of unsatisfactory treatment than due to any inherent difficulty. The first fourteen chapters contain the analytical development, commencing with circuits containing resistance and self-induction only, resistance and capacity only, and proceeding to more complex circuits containing resistance, self-induction, and capacity, and resistance and distributed capacity. A feature is the numerical calculations given as illustrations. The remaining chapters are devoted to the graphical consideration of the same subjects, enabling a reader with little mathematical knowledge to follow the authors, and with extensions to cases that are better treated by the graphical than by the analytical method.

CONTENTS.

**Part I. Analytical Treatment.**—Chapter I. Introductory to Circuits containing Resistance and Self-induction.—Chapter II. On Harmonic Functions.—Chapter III. Circuits Containing Resistance and Self-induction.—Chapter IV. Introductory to Circuits Containing Resistance and Capacity.—Chapter V. Circuits Containing Resistance and Capacity.—Chapters VI, VII, VIII, IX, X, XI. Circuits Containing Resistance, Self-induction, and Capacity.—Chapters XII, XIII. Circuits Containing Distributed Capacity and Self-induction.

**Part II. Graphical Treatment.**—Chapters XIV, XV, XVI, XVII. Circuits Containing Resistance and Self-induction.—Chapter XVIII, XIX. Circuits Containing Resistance and Capacity.—Chapter XX. Circuits Containing Resistance, Self-induction, and Capacity.

**Appendix A.** Relation between Practical and C. G. S. Limits.—Appendix B. Some Mechanical and Electrical Analogies.—Appendix C. System of Notation Adopted.

Sent, prepaid, on receipt of price.

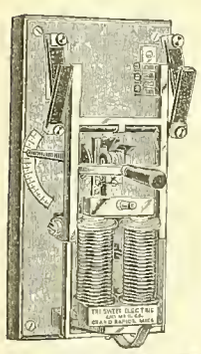
(Established 1881.)

Wallace Electric Co., Agents, 307 Dearborn Street, Chicago, Ill.

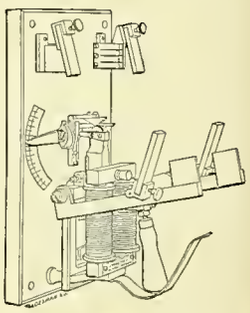
---

# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

WE KNOW YOU NEED OUR CIRCUIT BREAKER, and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. To be used on the Alternating or Direct Current Systems.



WRITE US AT ONCE.

# "SIX 16 C. P., 75 VOLT LAMPS."

From our 50-volt, 5-light Dynamo.

Read the Following Unsolicited Testimonial—Then Send for Our Circular No. 44.

ELBRIDGE ELECTRICAL MFG. COMPANY.

NATICK, MASS, November 15, 1894.

GENTLEMEN:—The 5-light, 50-volt dynamo was received in good order and tested with the following results: The dynamo gave 75 volts and *easily lighted six lamps of 16 C. P.;* also an arc lamp of 3,500 C. P. As a motor it ran perfectly and without noise on a 75-volt circuit, starting on 1¾ volts and giving ¾ H. P. at 75 volts. In these experiments the armature and field coils did not heat, which is remarkable, as the machine was one of your regular 50-volt windings. The dynamo is all you claim for it and more, and I shall be pleased to give parties desiring it any information possible on receipt of stamp for postage. Hoping you will have an abundance of orders, which your work merits, I remain,

Yours respectfully, HERBERT BLAKE.

RESPONSIBLE, ENERGETIC AGENTS WANTED IN UNOCCUPIED TERRITORY.

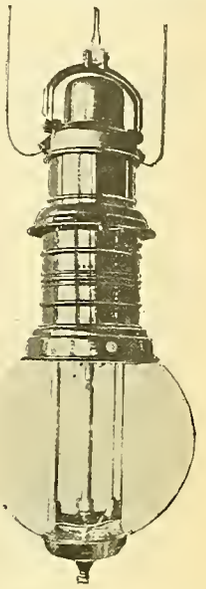
## New Alternating Arc Lamp

### For Street Lighting

No. 13.
Ioside 7 Ampere 7 Hour Lamp.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.

We have just completed a new direct current lamp which we guarantee will not **SEE-SAW.** The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

*Low Potential*
*Direct Current Lamps*

THE

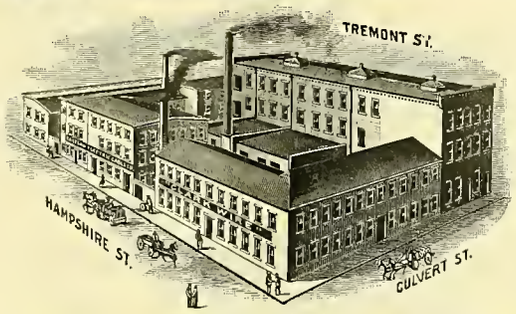
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

Western Agents,
GREAT WESTERN MFG. CO.,
Chicago, Ill.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# YOU NEED THESE BOOKS.

NEW
## DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages. 138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages. 42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS. "TRAMS."

*Their Construction, Operation and Maintenance.*

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## *THE PRACTICAL MANAGEMENT OF* DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.

*Experiments with Alternate Currents.*

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embracee works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

# WESTERN ELECTRIC CO., CHICAGO.

# "IT GIVES SATISFACTION."

How do you know? EVERYBODY that has used it tell us so and we believe *them*. N. I. R. Wire has been used in the City of Chicago in a majority of the largest buildings that have lately been constructed, and has been subjected to the severest tests. Among the most notable buildings, we are pleased to mention the "Ryerson Laboratory," "New York Life Building," "Medinah Temple," "Y. M. C. A.," "Elevated Railroad Stations," and many of the large packing houses, and numerous other buildings equally as important. **One Contractor alone has used over one million feet.** N. I. R. Seamless Insulation has very high insulating qualities, and is less susceptible to destructive influences of heat, cold, moisture and gases than other insulation. FINE PARA RUBBER only is used, and the SEAMLESS INSULATION is superior to any having seams. THE NATIONAL INDIA RUBBER COMPANY employs only skilled workmen and has had over 30 years experience in the manipula ion of India Rubber. As General Western Agents, we carry a large stock on hand and are always ready to execute any size orders with dispatch. Send us a trial order.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderfol steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are, also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

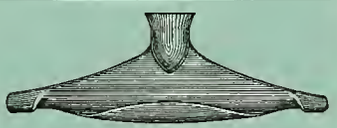
The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

John A. Roebling's Sons Co.,

New York. Chicago. San Francisco. TRENTON, N. J.

"H. W. J." MECHANICAL CLIP.



An exceedingly simple and practical device consisting of a single casting—no parts to break or get out of order. Provides a straight under-run for and does not damage the trolley wheel. It holds the wire securely and is practically non-sparking. It is safe, economical and saves time.

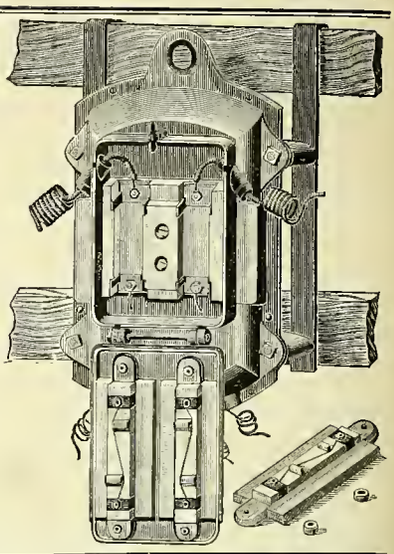
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

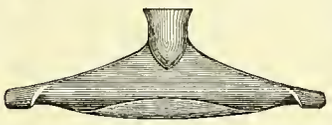
Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

Chicago Office, 1307 Manhattan Building, Central Electric Co., Selling Agents.

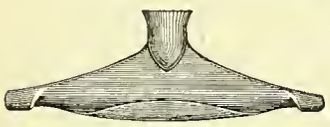
# "H. W. J." MECHANICAL CLIP.



An exceedingly simple and practical device consisting of a single casting—no parts to break or get out of order. Provides a straight underrun for and does not damage the trolley wheel. It holds the wire securely and is practically non-sparking. It is safe, economical and saves time.

Send for new and revised price list of

## Trolley Line Insulating Materials.



## H. W. JOHNS MFG. CO.,

240 AND 242 Randolph St.,

CHICAGO, ILL.

New York. Philadelphia. Boston.

# ARC LAMPS FOR INCANDESCENT CIRCUITS,

**Both Alternating and Direct.**

Standard "Ward" Lamps, - $10 Each.

TWO IN SERIES ON 110 VOLTS. Globe and Resistance, $2 extra per lamp.

A COMPLETE LINE of ENTIRELY NEW Arc Lamps.

SIMPLEST. STRONGEST. SUREST FEED.

Easiest and Cheapest to Maintain.

SPECIAL LAMPS OF ALL KINDS.

Write us for Circulars.

We carry a stock of FIDELITY carbons and IMPORTED CORED carbons, which we are selling at reduced prices.

Users of Arc Lamps should Write us for Prices.

## THE CUTTER ELECTRICAL & MFG. CO.,

*27 So. 11th Street, Philadelphia, Pa., U. S. A.*

# TELEPHONE WIRE AND CABLES.

Every Telephone Company in the United States is using Kerite Wire and Cables. Kerite is the Standard of High Grade Insulation, and will Cut Last and Out Class any other on the Market.

SEND FOR SAMPLES AND PRICES.

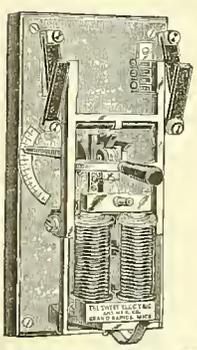
## CUSHING & MORSE,

General Western Agents,
225 Dearborn St., Chicago.

## W. R. BRIXEY, Mfr.

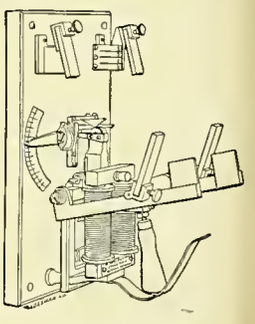
203 Broadway, New York.

# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

**WE KNOW YOU NEED OUR CIRCUIT BREAKER,** and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



WRITE US AT ONCE.

You want apparatus of the most

## PERFECT MECHANICAL AND ELECTRICAL CONSTRUCTION

To insure ***Long Life*** and ***Economy of Operation,*** and to avoid repairs. Write to us and we will tell you all about that kind of apparatus.

---

## Commercial Electric Company,

115 South Capitol Avenue, - - - INDIANAPOLIS, IND.

# THE STANLEY

## Two-Phase System of Alternating Apparatus,

***The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.***

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense in generators have been entirely eliminated from the Stanley; *i.e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

---

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

## STANLEY ELECTRIC MFG. CO., PITTSFIELD, MASS.

**Western Office, 307 Dearborn Street, Chicago, Ill.**

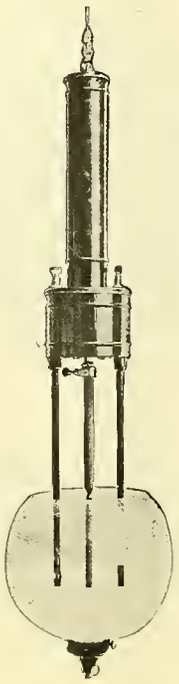
# THE HELIOS

## New Alternating Arc Lamp

### For Street Lighting

No. 13.
Inside 7 Ampere 7 Hour Lamp.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.



We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.

No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

*Low Potential Direct Current Lamps*

THE

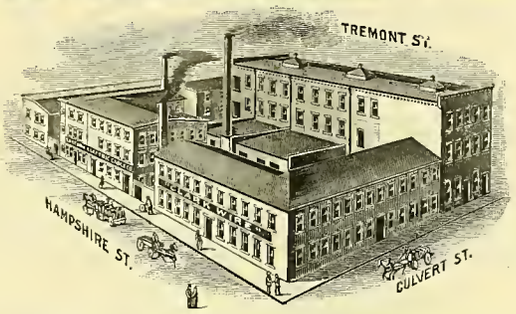
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**Western Agents,**
**GREAT WESTERN MFG. CO.,**
**Chicago, Ill.**



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## D'UNGER TELEPHONE.

Beware of Infringing or using Infringing Instruments.

**The Only Self-Cleaner.—The Peer of All.**

The D'Unger Telephone (its reputation as the best instrument ever constructed now fully established) is the *only* instrument in which the *power of the voice* is increased; the *only* instrument in which *the electric current is intensified* by the action of the voice; the *only* instrument in which *the voice-wave is reduced.* No telephone can be built with these wonderful advantages *without the use of a lever.* The D'Unger Long-Distance Telephone Com any has *the sole and exclusive right to use a lever in telephones—remember that.*

These instruments are supplied to exchanges and toll lines on a small annual royalty. They cannot be had on any other terms.

*The D'Unger Long-Distance Telephone Company* owns the *first* and *only undisputed patent for an All-Carbon Multiple-Contact Telephone in this country.* All persons who assert that this company's patents infringe upon any other patents are guilty of premeditated falsehood.

Address all letters to **R. D'Unger,** Manager, Palmer House, Chicago, Ill.

## Continuous Current Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

**With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.**

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

**CONTENTS.**

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turntables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickmen, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

# Alternating Currents.

**An Analytical and Graphical Treatment for Students and Engineers.**

BY FREDERICK BEDELL, PH.D.,

AND

A. C. CREHORE, PH.D.

**Cloth, 325 pages, 112 illustrations, Price, $2.50.**

The present work is the first book that treats the subject of alternating currents in a connected, logical, and complete manner. The principles are gradually and logically developed from the elementary experiments upon which they are based, and in a manner so clear and simple as to make the book easily read by any one having even a limited knowledge of the mathematics involved. By this method the student becomes familiar with every step of the proces of development, and the mysteries usually associated with the theory of alternating currents are found to be rather the result of unsatisfactory treatment than due to any inherent difficulty. The first fourteen chapters contain the analytical development, commencing with circuits containing resistance and self-induction only, resistance and capacity only, and proceeding to more complex circuits containing resistance, self-induction, and capacity, and resistance and distributed capacity. A feature is the numerical calculations given as illustrations. The remaining chapters are devoted to the graphical consideration of the same subjects, enabling a reader with little mathematical knowledge to follow the authors, and with extensions to cases that are better treated by the graphical than by the analytical method.

CONTENTS.

**Part I. Analytical Treatment**—Chapter I. Introductory to Circuits containing Resistance and Self-induction.—Chapter II. On Harmonic Functions—Chapter III. Circuits Containing Resistance and Self-induction.—Chapter IV. Introductory to Circuits Containing Resistance and Capacity.—Chapter V. Circuits Containing Resistance and Capacity.—Chapters VI, VII, VIII, IX, X, XI. Circuits Containing Resistance, Self-induction, and Capacity.—Chapters XII, XIII. Circuits Containing Distributed Capacity and Self-induction.

**Part II. Graphical Treatment.**—Chapters XIV, XV, XVI, XVII. Circuits Containing Resistance and Self-induction.—Chapters XVIII, XIX. Circuits Containing Resistance and Capacity.—Chapter XX. Circuits Containing Resistance, Self-induction, and Capacity.

**Appendix A.** Relation between Practical and C. G. S. Limits.—Appendix B. Some Mechanical and Electrical Analogies.—Appendix C. System of Notation Adopted.

Sent, prepaid, on receipt of price.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

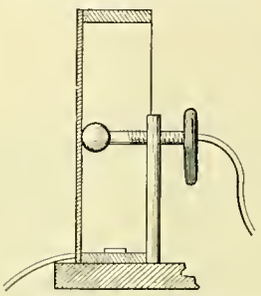

FIG. 44. BERLINER'S FIRST TRANSMITTER.

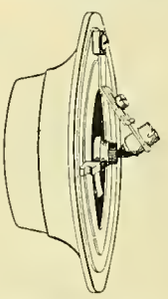

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

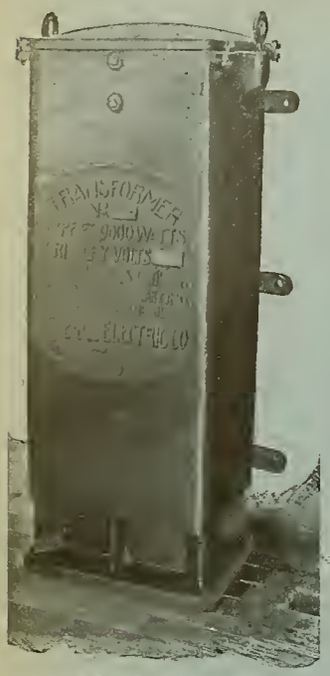
**EDDY**

**MOTORS** *From 1-2 H. P. Upwards. All Apparatus Guaranteed as Represented.* THE EDDY ELECTRIC MFG. CO., WINDSOR, CONN.



Largest Size Type F Transformer.

# TRANSFORMERS.

By the use of Transformers of our design and construction are obtained:

**Safety to Life and Property.**

**Efficiency** higher than in those of any other make.

**Regulation of Potential** perfect in its operation.

**Durability** attested by long experience.

**Convenience** in installation and maintenance.

**The Characteristics of our Type F Transformers are:**

**SIMPLICITY of CONSTRUCTION**—All accessories that can be sacrificed without impairing the value of the apparatus have been excluded from the box.

**PERFECTION OF INSULATION**—Obtained by the use of the highest grade insulating materials. As an additional protection, the core and coils are entirely immersed in oil, an extra safety factor only found in our Transformers.

**SUBDIVISION OF THE COILS**—Secondary winding the nearer to the iron core and the primary coils so subdivided that the greatest difference of potential between any two contiguous parts of the two windings brought down to only half the primary voltage.

**ABSENCE OF FUSES**—No dangerous opening of the Transformer to replace a blown fuse. Our Transformers may be installed in absolutely safe position almost inaccessible and the fuse box be easily accessible.

**SMALL CORE LOSS**—Only the most carefully tested iron used. Foucault currents eliminated and hysteresis reduced to a minimum.

**ABILITY TO WITHSTAND STRAIN**—All our Transformers are subjected to an efficiency test; a test under ordinary operating conditions, a test under 5,000 volts' pressure from coil to coil and coils to core, and a test exposing each turn to twice the strain of ordinary practice. All tests made without oil.

**COOLNESS OF OPERATION**—The oil acts as a cooling medium and adds to the efficiency as well as aiding the regulation in the Transformer.

## STEP UP and STEP DOWN TRANSFORMERS.

Write for our new Transformer pamphlet.

## SUB-STATION TRANSFORMERS.

200 K. W. Sub-Station Transformer, with Cool Air Blast.

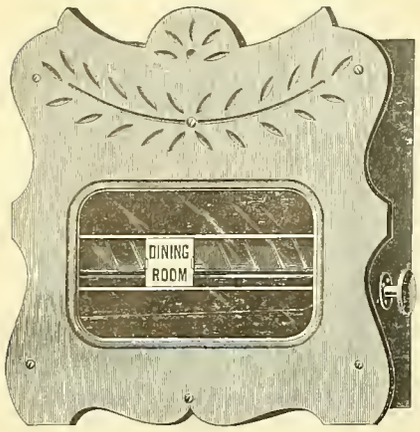
Our Motto: The Very Best Goods at the Very Lowest Prices.



# Eclipse Annunciator

The simplest and most reliable Annunciator made.
Not a spring or screw in the working parts.
Absolutely nothing to get out of adjustment, and
It requires but very small battery power

**Proctor-Raymond Electric Co.**
ROCHESTER, N. Y.

---

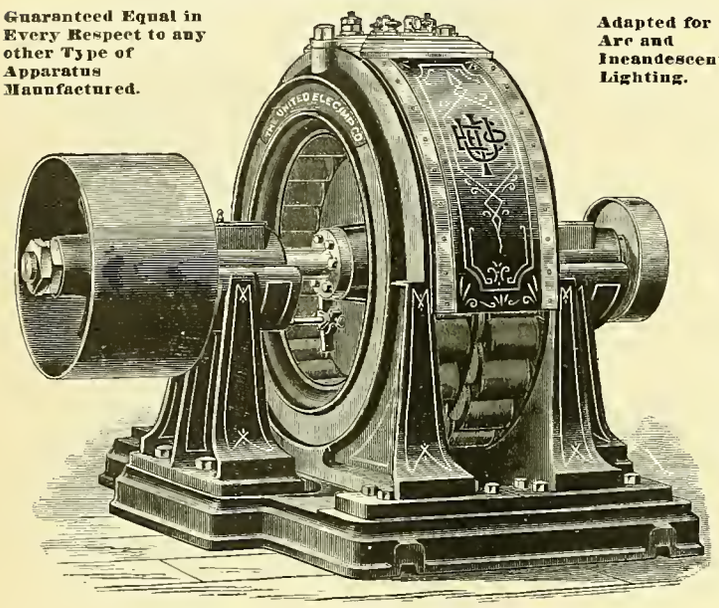
**SINGLE OR MULTIPHASE,**

## Alternating Current Generators,

**For Central Station Equipment.**

**Guaranteed Equal in Every Respect to any other Type of Apparatus Manufactured.**

**Adapted for Arc and Incandescent Lighting.**



Slow Speed and Close Regulation.

Standard of Simplicity and Durability.

**ALSO**

Direct Current Apparatus for Lighting Factories, Public Buildings and Isolated Plants.

Improved Long Distance Series Incandescent Apparatus for Street and Commercial Illumination.

Incandescent Lamps and Sockets for use on Arc Light Circuits.

**Correspondence Solicited.**

**THE UNITED ELECTRIC IMPROVEMENT CO.,**
19th St. and Alleghany Ave., Philadelphia, Pa.

---

## ARC LAMPS FOR INCANDESCENT CIRCUITS,

**Both Alternating and Direct.**

Standard "Ward" Lamps, - $10 Each

TWO IN SERIES ON 110 VOLTS. Globe and Resistance, $2 extra per lamp.

**A COMPLETE LINE of ENTIRELY NEW Arc Lamps.**

**SIMPLEST. STRONGEST. SUREST FEED.**

Easiest and Cheapest to Maintain.

SPECIAL LAMPS OF ALL KINDS.

**Write us for Circulars.**

We carry a stock of FIDELITY carbons and IMPORTED CORED carbons, which we are selling at reduced prices.

**Users of Arc Lamps should Write us for Prices.**

**Electric Construction & Supply Co.,**
18 Cortlandt Street, New York.
(Established 1881.)

**Wallace Electric Co., Agents, 307 Dearborn Street, Chicago, Ill.**

---

## "H. W. J." MECHANICAL CLIP.

An exceedingly simple and practical device consisting of a single casting—no parts to break or get out of order. Provides a straight underrun for and does not damage the trolley wheel. It holds the wire securely and is practically non-sparking. It is safe, economical and saves time.

Send for new and revised price list of

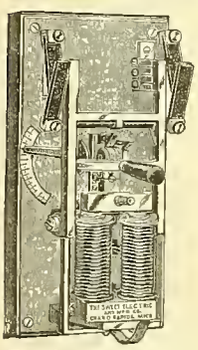
Trolley Line Insulating Materials.

**H. W. JOHNS MFG. CO.,**

240 and 242 Randolph St.,
CHICAGO, ILL.
New York. Philadelphia. Boston.

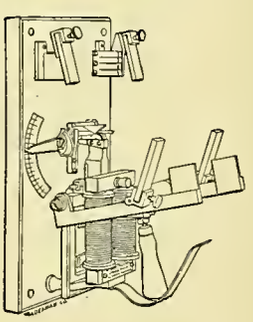
---

# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

**WE KNOW YOU NEED OUR CIRCUIT BREAKER,** and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



**WRITE US AT ONCE.**

**SWEET ELECTRIC & MFG. CO.,**
GRAND RAPIDS, MICH.

# HELIOS CORED CARBONS.

FOR

# Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

## By the man who made them in Germany.

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both Alternating and Direct Currents.

A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture, will be sent on application.

## Reduced Prices on Solid Carbons for Series Arc Lighting.

# A DEPARTURE IN BUSINESS METHODS!

NOTE THIS OFFER:---Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand. This is no "bluff" but is "dead cold" business.

# THE WASHINGTON CARBON COMPANY,

PITTSBURG, PA.

THE

# Chloride Accumulator.

The Electric Storage Battery Company has acquired all the patents and patent rights concerning the manufacture of electric storage batteries of the General Electric Company, the Edison Electric Light Company, the Thomson-Houston Electric Company, the Brush Electric Company, The Accumulator Company, The Consolidated Electric Storage Company and the General Electric Launch Company, whereby The Electric Storage Battery Company has secured to itself the sole right to supply in the United States electric storage batteries of all the various important types heretofore developed, as well as the protection of every decision heretofore rendered by the United States courts in the interpretation of electric storage battery patents.

The acquisition of these patents not only terminates all litigation heretofore existing, but insures the company against any future attacks, as the patents acquired, together with those originally owned by The Electric Storage Battery Company, cover all the known principles involved in storage batteries.

The Company has also increased largely its cash working capital, and is fully prepared to fill all orders for storage batteries promptly.

Catalogue containing full description of the various types of elements, weights, capacities, dimensions, etc., and price list, furnished on application.

## THE ELECTRIC STORAGE BATTERY CO.,

838 DREXEL BUILDING, PHILADELPHIA.

ABSOLUTELY ACID-PROOF, WATER-PROOF, WEATHER-PROOF.

# COLLINS' COMPOUND

## FOR INSULATION OF EVERY KIND OF ELECTRICAL WORK.

Does not smell bad. Does not cost much.
Ask your supply dealer for it.
Insist on getting it.
Write us for printed matter and quotations.

An imperishable paint for preserving METAL, WOOD and FABRICS. Can be used on ARMATURES, in place of shellac or other varnish, with perfect safety. Invaluable for Mouldings, Cut-out Boxes, and all Electrical work where insulating paint is specified or needed. Will not peel off from metal or crack on wood.

## FAVORITE TAPE
## L.C. SPLICING COMPOUND.

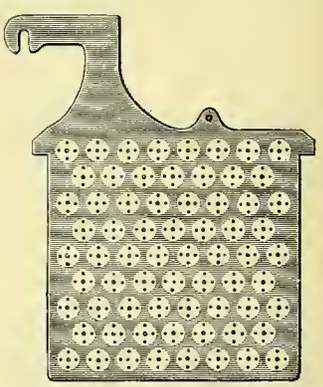
Electrical Storage Cells of any desired capacity. Catalogues giving Capacities, Dimensions, Weights, Prices, etc., on application.



CHICAGO, Wabash Avenue and Lake Street.

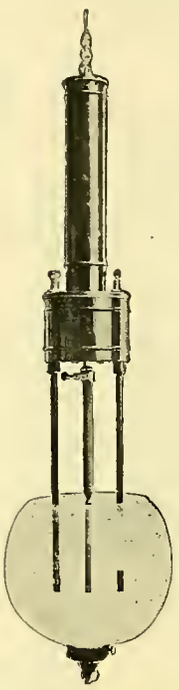
# THE HELIOS

No. 13.
Inside 7 Ampere 7 Hour Lamp.

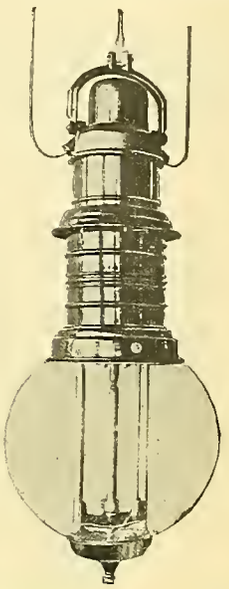
## New Alternating Arc Lamp

### For Street Lighting

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.



We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

*Low Potential Direct Current Lamps*

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

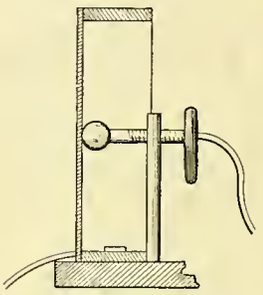

FIG. 44. BERLINER'S FIRST TRANSMITTER.

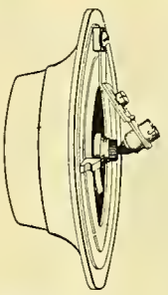

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

### PART I.—Polyphase Currents.

CHAPTER 1....Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

### PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

### PART III.—Miscellaneous Inventions and Writings.

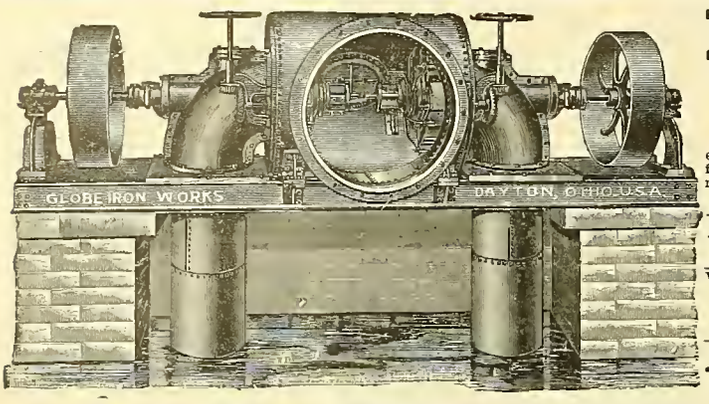
CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

### PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

**This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by**

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.**



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.68 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195 19 | 82.58 |
| ¾ " | 16.78 | 117.33 | 112.60 | 175 74 | 82.18 |
| ⅝ " | 17.03 | 111.83 | 98.12 | 149.99 | 79.31 |
| ½ " | 16.88 | 118.67 | 82.07 | 118 40 | 75.52 |

Test of a 42-inch Wheel July 14, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.33 | 128.00 | 134.18 | 199.56 | 80.50 |

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

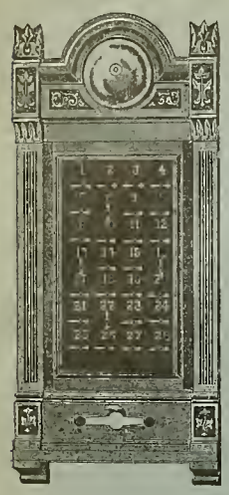
The New "Wood" 3,000 Light Ironclad Alternator, Type W. A. 150, 1893.



# A DAISY.

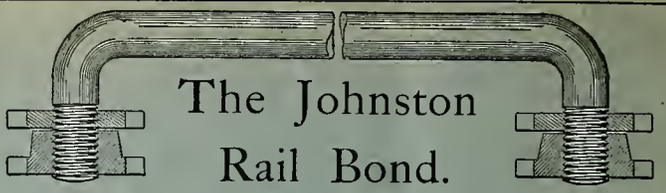
We guarantee our Annunciators to be

## Simple, Reliable and Durable.

Made in all sizes.
Handsomely finished.
Cheaper than inferior makes.

☞Correspond with us before placing your order.

**WASHINGTON ELECTRIC CO.,**
201-207 S. Canal St., Chicago.



## The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

**John A. Roebling's Sons Co.,**

New York. Chicago. San Francisco. TRENTON, N. J.

# TELEPHONE
## WIRE AND CABLES.

Every Telephone Company in the United States is using Kerite Wire and Cables. Kerite is the Standard of High Grade Insulation, and will Cut Last and Out Class any other on the Market.

SEND FOR SAMPLES AND PRICES.

Largest Size Type F Transformer.

# TRANSFORMERS.

By the use of Transformers of our design and construction are obtained:

**Safety to Life and Property.**

**Efficiency** higher than in those of any other make.

**Regulation of Potential** perfect in its operation.

**Durability** attested by long experience.

**Convenience** in installation and maintenance.

**The Characteristics of our Type F Transformers are:**

**SIMPLICITY of CONSTRUCTION**—All accessories that can be sacrificed without impairing the value of the apparatus have been excluded from the box.

**PERFECTION OF INSULATION**—Obtained by the use of the highest grade insulating materials. As an additional protection, the core and coils are entirely immersed in oil, an extra safety factor only found in our Transformers.

**SUBDIVISION OF THE COILS**—Secondary winding the nearer to the iron core and the primary coils so subdivided that the greatest difference of potential between any two contiguous parts of the two windings brought down to only half the primary voltage.

**ABSENCE OF FUSES**—No dangerous opening of the Transformer to replace a blown fuse. Our Transformers may be installed in absolutely safe position almost inaccessible and the fuse box be easily accessible.

**SMALL CORE LOSS**—Only the most carefully tested iron used. Foucault currents eliminated and hysteresis reduced to a minimum.

**ABILITY TO WITHSTAND STRAIN**—All our Transformers are subjected to an efficiency test; a test under ordinary operating conditions, a test under 5,000 volts' pressure from coil to coil and coils to core, and a test exposing each turn to twice the strain of ordinary practice. All tests made without oil.

**COOLNESS OF OPERATION**—The oil acts as a cooling medium and adds to the efficiency as well as aiding the regulation in the Transformer.

## STEP UP and STEP DOWN TRANSFORMERS.

## SUB-STATION TRANSFORMERS.

Write for our new Transformer pamphlet.

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

*NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.*

# THE WASHINGTON CARBON COMPANY, - PITTSBURG, PA.

THE

# Chloride Accumulator.

The Electric Storage Battery Company has acquired all the patents and patent rights concerning the manufacture of electric storage batteries of the General Electric Company, the Edison Electric Light Company, the Thomson-Houston Electric Company, the Brush Electric Company, The Accumulator Company, The Consolidated Electric Storage Company and the General Electric Launch Company, whereby The Electric Storage Battery Company has secured to itself the sole right to supply in the United States electric storage batteries of all the various important types heretofore developed, as well as the protection of every decision heretofore rendered by the United States courts in the interpretation of electric storage battery patents.

The acquisition of these patents not only terminates all litigation heretofore existing, but insures the company against any future attacks, as the patents acquired, together with those originally owned by The Electric Storage Battery Company, cover all the known principles involved in storage batteries.

The Company has also increased largely its cash working capital, and is fully prepared to fill all orders for storage batteries promptly.

Catalogue containing full description of the various types of elements, weights, capacities, dimensions, etc., and price list, furnished on application.

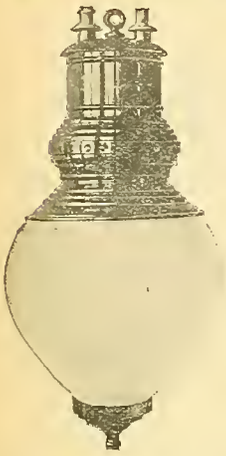
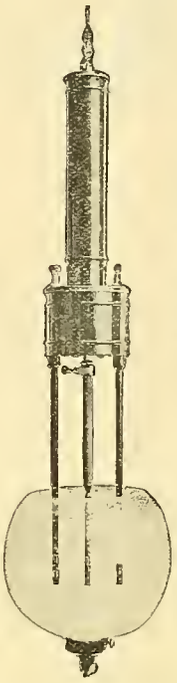
## New Alternating Arc Lamp

### For Street Lighting

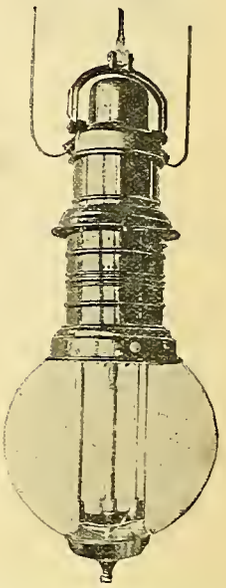


No. 13.
Ipeide 7 Ampere 7 Hour Lamp.

New Alternating Lamp 900 c. p., 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.



We have just completed a new direct current lamp which we guarantee will not SEE-SAW. The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connectioo with Special 33 Volt Transformer.

*Low Potential*
*Direct Current Lamps*

**Helios Electric Company** PHILADELPHIA, PA.

# THE S. K. C. SYSTEM OF
# Two-Phase Alternating Current Apparatus.

***The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.***

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense have been entirely eliminated from this generator; *i. e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

# Stanley Electric Mfg. Co.,

**Western Office, 307 Dearborn St., CHICAGO.** PITTSFIELD, MASS.

# TELEPHONES.

## THE VIADUCT CO., BALTIMORE,

Has made more **MAGNETO TELEPHONE BELLS** than all the manufacturers in the United States combined, with one exception. Their superiority over **ALL** others is fully acknowledged by those who have used them continuously during the past **SIXTEEN** years, and it will not depart from this record of making the **BEST**. The standard workmanship will be maintained with its

**TELEPHONES.**

Purchasers and users will appreciate this, that with a CHEAP bell the Telephone is useless, because you must first attract the attention of your correspondent, and if the bell (which is the essential instrument of the set) does not ring, you may as well be without the Telephone.

Our **ARM REST** Bell, patented May 30, 1893, is a success. This company MANUFACTURES and guarantees everything it sells, and has been doing so twenty-three years. Send for catalogue, enclose business card and mention this paper.

**VIADUCT MFG. CO., 8 So. Howard St., Baltimore, Md.**

The most Powerful Receiver Known—Patented May 29, 1894.

"NATIONAL" COMPOUND RECEIVER.

# The "NATIONAL."

We make simply a business proposition. Buy two sets of our instruments and make your own tests. If satisfactory the way is open for more business, either in telephones or switchboards for exchanges.

Our head telephones are largely used by Bell telephone operators.
The "NATIONAL" is in use at the U. S. Military Academy, West Point, N. Y.

THE

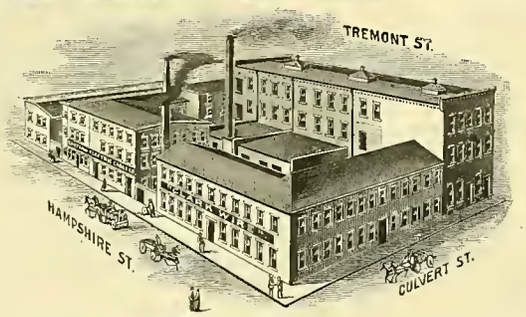
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.
HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

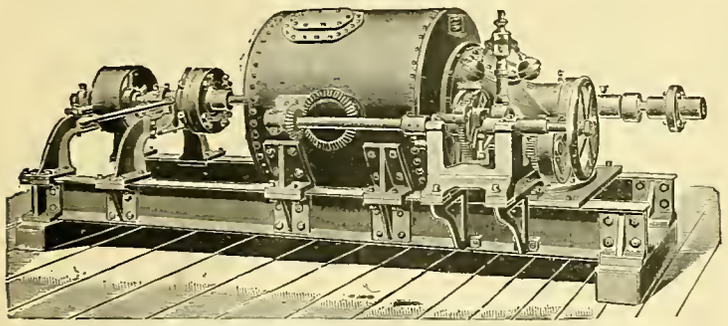
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

oompletely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

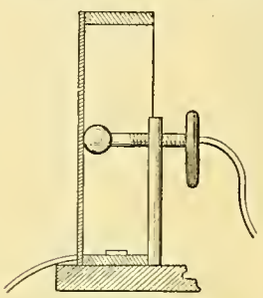

FIG. 44. BERLINER'S FIRST TRANSMITTER.

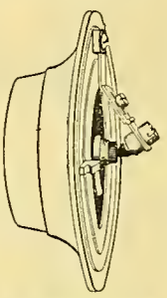

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

### PART I.—Polyphase Currents.

CHAPTER 1. ..Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

### PART II.—The Tesla Effects with High Frequency and High Potential Currents.

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

### PART III.—Miscellaneous Inventions and Writings.

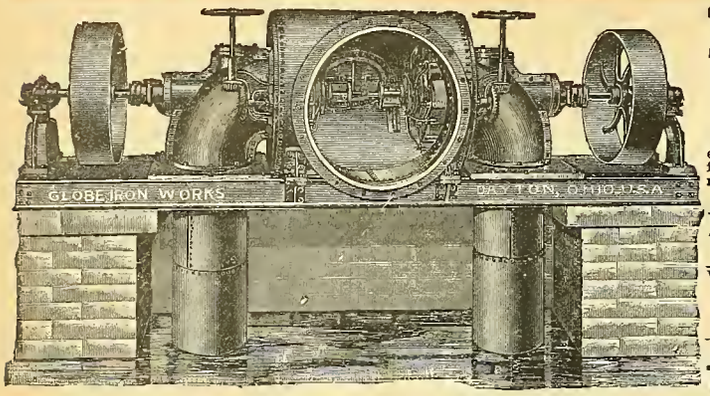
CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

### PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

**This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by**

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.**



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

# THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

# ELECTRIC RAILWAY MOTORS.

Their Construction, Operation and Maintenance.

An elementary practical hand-book for those engaged in the management and operation of electric railway apparatus.

## With Rules and Instruction for Motormen.

By NELSON W. PERRY, E. M.

Price, Postage free, **$1.00.** PRACTICAL AND UP-TO-DATE.

TABLE OF CONTENTS.

I. Introduction.—II. Technical Terms, etc.—III. Ohm's Law; Rate of Work; Examples.—IV. Electric Current and Its properties.—V. The Electric Current and Its Properties (continued); The Solenoid.—VI. Measuring the Current: Magnetism and Electro-Magnetism.—VII. Lines of Force; The Closed Magnetic Circuit; Magnetic Leakage.—VIII. Polarity, Magnetism and Current.—IX. Electro-Magnetic Induction; The Continuous Current Dynamo; Increase of Electromotive Force; Eddy Current in Armature.—X. Shifting of the Armature Wires; Opened and Closed Coil Armatures.—XI. Drum and Ring Armatures; Consequent Poles and Multipolar Field Magnets.—XII. Multiple Arc and Series Arrangement; Current Characteristics of Multiple and Series Arrangements in Generators.—XIII. Current Characteristics in Translating Devices; Multipolar Fields.—XIV. The Dynamo Electric Principle; Series, Shunt and Compound Winding; The Reversibility of the Dynamo XV. The Electric Motor.—XVI. The Electric Motor (continued) Torque.—XVII. The Line of Commutation; Counter Electromotive Force.—XVIII. Counter Electromotive Force and Speed Regulation; Requirements of Speed Regulation.—XIX. The Sperry and Johnson-Loodell Systems.—XX. The Leonard, Perry and Other Systems; The Perry System of Series Electric Traction; Storage Battery Traction; Conduit Systems.—XXI. The Management of Street Railway Motors; Sparking at the Commutator; Motor Stops or Fails to Start.—XXII. Specific Directions to Motormen.—XXIII. Instructions to Inspectors and Superintendents.—XXIV. Locating Faults; Commutators; Drop Method of Testing for Faults; Insulation Test; Bearings; Gears and Pinions; Controllers.—XXV. Trolley Wheels, Incandescent Lamps; Conclusion.

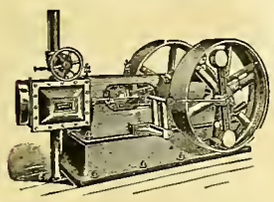
## J. H. McEWEN MFG. CO.,

Automatic Engines, both Vertical and Horizontal, from 12 to 600 h. p.



**OUR GUARANTEE:** The engine shall not run one revolution slower when fully loaded than when running empty, and a reduction of boiler pressure from the greatest to that necessary to do the work, will not reduce the speed of engine one revolution. Any engine failing to meet this guarantee becomes the property of the purchaser upon payment of one dollar.

It is one of the Most Economical Engines on the Market.
